CCM MODULAR PROCESSOR USERS' GUIDE (VERSION PROCO1)
Richard J. Wolski Jan. 1986 172 p
(Grant NSF ATM-82-17015)
(PB86-187069; NCAR/TN-261-IA) Avail: NTIS HC A08/MF A01 CSCL 04B

The NCAR CCM Modular Processor is the primary tool for the analysis of data output by the NCAR Community Climate Model. The User's Guide contains complete instructions for running the PROCO1 version of the Processor on the Crays at NCAR, and replaces Part 1 of the previous Users' Guide (NCAR/TN-216+IA), August 1983). Operations available in the PROCO1 version include the computation of spatial and time averages (plus related statistics), vertical interpolation to pressure surfaces, horizontal interpolation and filtering in spectral space, time filtering, comparison of different Model Case, and the computation of new quantities (derived fields) based on those output by the Model. Output from the Processor may take the form of printed values, binary data for subsequent analysis by the Processor or other programs, and a wide variety of graphics. Data may be plotted as (1) field-value curves, two-dimensional contours, or vector arrows, all on several spatial projections; (2) time series curves or contours; and (3) curves of spectral coefficients. NASA OCEANIC PROCESSES PROGRAM Annual Report, fiscal year 1985
Aug. 1986 162 p
(NASA-TM-88987; NAS 1.15:88987) Avail: NTIS HC A08/MF A01 CSCL 08C

This, the Sixth Annual Report for NASA's Oceanic Processes

Program, provides an overview of recent accomplishments, present activities, and future plans. Although the report was prepared for Fiscal Year 1985 (October 1, 1984 to September 30, 1985), the period covered by the Introduction extends into June 1986. Sections following the Introduction provide summaries of current flight projects and definition studies, brief descriptions of individual research activities, and a bibliography of refereed journal articles appearing within the past two years. INTERACTIONS BETWEEN OCEAN SURFACE WAVES AND CURRENTS Memorandum Report, Sep. 1984 - Aug. 1985
A. L. Cooper 2 Apr. 1986 21 p
(AD-A166688; NRL-MR-5755) Avail: NTIS HC A02/MF A01 CSCL 20/4

A mathematical model is developed to describe the interaction between random ocean surface waves and the wake produced by a surface ship. Calculations are presented for the mean square free surface displacement energy for the short wave length components of the wave field and Its modification due to refraction by the surface wake. It is demonstrated that a significant reduction of the short wavelength contribution to the surface energy can result from this interaction. A procedure to calculate the spectral composition of the free surface and the spatial realization of the free surface displacement is outlined. Free surface realizations will be presented in a forthcoming report. GRA

COAST OF CALIFORNIA STORM AND TIDAL WAVES STUDY: SOUTHERN CALIFORNIA COASTAL PROCESSES DATA SUMMARY
Douglas L. Inman, Robert T. Guza, David W. Skelly, and Thomas E. White Feb. 1986 580 p
(AD-A166699; CCSTWS-86-1) Avail: NTIS HC A25/MF A01 CSCL 08/3

The intent of this report is to provide a broad picture of the physical, mechanical and geological processes pertaining to coastal engineering along the shorelines of southern California, and to give references to data sources. Citation to the originators of concepts, theories, etc. are not always given because this is a data summary for the region, not a review of the nearshore processes literature. Interested readers should consult the extensive coastal engineering and nearshore processes literature for a historical perspective of the topics discussed. Because of space constraints, some topics are only scantily covered. Chapters 1 and 2 and portions of the following chapters were written by Douglas L. Inman. Chapter 3 and the sections on neashore waves and currents for each cell described in Chapters 4 through 11 were written by Robert T. Guza. For Chapters 4 through 11 the sections on coastal erosion, shoreline changes, sediment sources and the budget of sediment were written by David W. Skelly; while the sections on sediment transport modes and sediment sinks were written by Thomas E. White. Unpublished notes provided by Dr. Reinhard Flick were used for the preparation of Chapter 3.4 on tides and sea level fluctuations. GRA

COAST OF CALIFORNIA STORM AND TIDAL WAVES STUDY. SHORELINE MOVEMENT DATA REPORT: PORTUGUESE POINT TO MEXICAN BORDER (1852-1982)
Paul F. May and Brian M. Baldwin Dec. 1985 172 p
(AD-A166749; CCSTWS-85-10) Avail: NTIS HC A08/MF A01 CSCL 08/6

This report describes the results of a cooperative study of shoreline movement conducted as part of the Coast of California Storm and Tidal Waves Study (CCSTWS). The study area comprised the Pacific Ocean coast from Portuguese Point. CA, (Near Los Angeles) south to the United States/Mexico Border, a distance of approximately 125 miles. Changes in shoreline position ranging from as early as 1852 or as late as 1959, up to 1982, are analyzed using survey data from NOAA's National Ocean Service (NOS) and its predecessor, the U.S. Coast and Geodetic Survey. A series of shoreline movement maps for this coastal reach produced by NOS is intended to accompany this report. This report provides a basic data set for use in management and engineering decisions related to the coastal zone. It is designed primarily to describe and partially quantify shoreline movement maps that accompany it. Average yearly land area and shoreline movement rates of change were calculated for each minute of longitude for the area from Portuguese Point south to Anaheim Bay (east-west-trending shoreline), and for each minute of latitude from Anaheim Bay to the U.S./Mexico border (north-south trending shoreline). The sole purpose of this report is to describe and quantify historic shoreline movement. No attempts were made to identify or even speculate on the reasons for these movements. GRA

N86-31202# Army Engineer District, Los Angeles, Calif. Coastal Resources Branch.
COAST OF CALIFORNIA STORM AND TIDAL WAVES STUDY: SOUTHERN CALIFORNIA COASTAL PHOTOGRAPHY AND BEACH PROFILE INDEX
Feb. 1986 140 p
(AD-A166780; CCSTWS-86-2) Avail: NTIS HC A07/MF A01 CSCL 08/6

The purpose of this report is to compile an inventory of the aerial photography, ground photos and beach profile data long the Coast of California that are available in the U.S. Army Corps of Engineers, Los Angeles District (LAD; also includes other Federal, State, and local governmental agencies). These photographs and beach profiles were compiled to document dimensions and beach characteristics, historic shoreline changes, effects of storms and structures on the beach, and any significant beach and inlet changes. The information described in this report is available for use and inspection by Government agencies, educational institutions, coastal engineers and other coastal interest groups. GRA

N86-31203# Army Engineer District, Los Angeles, Calif. Coastal Resources Branch.
COAST OF CALIFORNIA STORM AND TIDAL WAVES STUDY. HYDRAULIC DATA INVENTORY: SOUTHERN CALIFORNIA COASTAL ZONE
Dec. 1985 39 p
(AD-A166781; CCSTWS-85-9) Avail: NTIS HC A03/MF A01 CSCL 08/8

This report is a literature review and data summary covering the topics of river sediment discharge, lagoon storage, streambed sediment, and wind transport. This literature review and data summary are limited to California coastal rivers/streams between Ragged Point (San Luis Obispo County) and the Mexican border and are limited to literature containing measurements or quantitative estimates pertaining to the above topics. A summary of results is as follows. Twenty-three references were located which contain quantitative information on river sediment discharge. Practically no quantitative information on lagoon sediment storage for Southern California was located during this review. Seven references were located which contain results of sediment gradation tests of streambed samples. These references give data for 11 Southern California streams. No quantitive information on wind transport of sediment was located for the Southern California Coast. Some information concerning coastal sand dune locations in one reference and some concerning wind direction in another reference may be useful for estimating wind transport in future analyses. GRA

COAST OF CALIFORNIA STORM AND TIDAL WAVES STUDY. HYDRAULIC DATA INVENTORY: SOUTHERN CALIFORNIA COASTAL ZONE
Dec. 1985 282 p
(AD-A166782; CCSTWS-85-8) Avail: NTIS HC A13/MF A01 CSCL 08/8

This report details the results of a data search on the hydrology

of the coastal watersheds between Ragged Point, San Luis Obispo County and the U.S. - Mexican Border. Included in this report are general hydrological descriptions of the drainage areas, in order to provide background information. These sections are followed by detailed accounts of the sources of hydrologic data which are available. Data of interest include streamflow history at the shoreline of streams and stream groups, volume-frequency analyses, historic hydrographs of major floods, sediment yield, effects of various structures and fire effects. Included in the discussion are the location of data, data formats available and indications of the quality of the data. Data gaps and limitations are noted, and recommendations are presented for reducing these limitations. GRA

OCEANOGRAPHIC ANALYSIS OF SUN GLINT IMAGES TAKEN ON SPACE SHUTTLE MISSION STS 41-G M.S. Thesis
Mark G. Fischer Mar. 1986 42 p
(AD-A167142) Avail: NTIS HC A03/MF A01 CSCL 14/5

A series of four sun glint images taken by the crew of the space shuttle Challenger, mission STS 41-G, on 8 October 1984 were analyzed and compared to NOAA-7 AVHRR infrared images and to bathythermographs of the same area. Evidence of the Almaria Front, a persistant oceanographic feature east of the Alboran Basin, was found on all three data sets, and the efficacy of using sun glint images for the location of acoustically important oceanographic features was supported. A practical use of sun glint photographs taken from low earth orbit was demonstrated and the investigation of its use to help in the employment of acoustic sensors is further justified by this work. A GENERAL CIRCULATION MODEL INVESTIGATION OF THE ATMOSPHERIC RESPONSE TO EL NINO Ph.D. Thesis - Miami Univ.
Jose Oribe RochadeArago 1986 161 p
(Grant NSF ATM-82-17015)
(PB86-196243; NCAR/CT-100) Avail: NTIS HC A08/MF A01 CSCL 08C

The atmospheric response to sea surface temperature anomalies associated with El Nino episodes is simulated with the use of the NCAR general circulation model. The model features the annual march of both insolation and sea surface temperature. The model's tropical response is similar to the anomalous features which have been found in previous observational studies. For example, the upper level anticyclone pair in the central Pacific is present for almost all months. An anomalous Walker Circulation is found in the vertical plane along the equatorial region. Rainfall departures from the long-term mean are found elsewhere in the entire equatorial belt. GRA

ADVANTAGES OF THE GAS EXCHANGE APPROACH TO MICROBIOLOGICAL STUDIES Memorandum Report, 1983 - 1985
P. J. Hannan and D. S. Jones 3 Apr. 1986 43 p
(AD-A166887; NRL-MR-5744) Avail: NTIS HC A03/MF A01 CSCL 06/13

Studies of the effects of various chemical or physical stimuli on the growth rates of microorganisms generally involve some measure of biomass. In the case of algae, one might measure the cell number, the chlorophyll concentration, the fluorescence, or the wet weight of the culture as a function of time. Each such measurement requires a sampling of the culture which could be a disturbing factor in the system being measured. Another disadvantage of these traditional measurements is that the times required for significant change to take place in the culture might be hours or days; furthermore, growth rate measurements calculated from the data must be based on the assumption that during the time between measurements the growth rate was constant. This report describes another approach to the problem. It consists simply of monitoring the O2 or CO2 concentration of an air stream passing through the system (the gas exchange method), and it has several distinct advantages: (1) there is no need to take samples of the culture, (2) each measurement is a rate measurement and indicates the performance of the culture at that very moment, and (3) transitory changes in growth rates are readily detected. Examples are given of studies made previously with this method at NRL. Also the possible value of these methods in a study of the corrosion susceptibility of alloys is described. GRA

THE PREDICTION OF BIOLOGICAL ACTIVITY USING MOLECULAR CONNECTIVITY INDICES
Dennis H. Rouvray 23 Apr. 1986 31 p
(Contract N00014-84-K-0365)
(AD-A166986; TR-21) Avail: NTIS HC A03/MF A01 CSCL 06/15

A highly influential paper by Randic entitled On characterization of molecular branching appeared in the Journal of the American Chemical Society. In this paper a new topological index was introduced which has since become known as the molecular connectivity index. Topological indices (Tis) are graph-theoretical invariants which are employed extensively as matheamtical descriptors for a wide range of molecular species. They have been used mainly for the purpose of correlating the properties of molecular species with their topological structure. The molecular connectivity index was originally put forward with the aim of characterizing the branching in alkane species, but more recently has been shown to have numerous applications in both the physical and biological sciences. In this review we shall focus on the use of the index in the more biologically oriented sciences, such as pharmacology and toxicology. In particular, we shall discuss the prediction of biological activity in chemical species by means of this index. The molecular connectivity index as originally presented by Randic was designed to parallel the ordering obtained for sets of isomeric alkane molecules based on their physicochemical properties. GRA

LASER KINETIC SPECTROSCOPY OF UNIMOLECULAR AND BIMOLECULAR PROCESSES IN THE GAS PHASE Final Report, 1 Oct. 1982 - 30 Sep. 1985
Curt Wittig and Hanna Reisler 15 Nov. 1985 14 p
(Grant AF-AFOSR-0022-83)
(AD-A166998; AFOSR-86-0226TR) Avail: NTIS HC A02/MF A01 CSCL 07/5

This research is concerned with the study of unimolecular processes in the gas phase. We concentrated on simple bond fission reactions, and determined both the collision free unimolecular rates Benzylamine (C6H5CH2NH2), Nitrosomethane (CH3)3CNO), and the energy disposal in the products Nitroeyl cyanide (NCN0), Trifluoronitrile methane (CF3CN), Cyanogeniodide (ICN). Most of the molecules were dissociated either via IRMPD(CF3CN, C6H5CH2NH2) or by electronic excitation followed by radiationless transitions (NCNO(CH3)3CNO). They exhibited statistical behavior, and the results were compared with the predictions of statistical theories. The most detailed experiments involved the photodissociation of NCNO, which provided complete mapping. of product internal states. The CN and NO E,V,R distributions are textbook examples of statistical product state distributions deriving from a unimolecular reaction. In our studies

of the direct photodissociation of ICN, we obtained sub-Doppler LIF spectra of nascent CN(X2 sigmat state), following the 266 nm photolysis of 300 K molecules. These studies provided a detailed picture of the fragment recoil spatial anisotropies as well as CN E,V,R, T and and I/I excitations. The CN rotational distributions were dissected into two separate distributions for the channels producing I and I. GRA

THE EFFECT OF BREATHING ELEVATED CO2 GAS MIXTURES ON TRACKING PERFORMANCE, BLOOD PRESSURE, AND SUBJECTIVE TOLERANCE AT 1Gz
Thomas G. Shriver, Daniel W. Repperger, John W. Frazier, Charles D. Goodyear, and Lloyd D. Tripp Mar. 1986 52 p
(Contract F33615-81-C-0500)
(AD-A165974; AAMRL-TR-86-006) Avail: NTIS HC A04/MF A01 CSCL 06/19

The addition of small concentrations (5-10%) of carbon dioxide (CO2) to the breathing gas has been identified as a possible technique to increase Gz tolerance for pilots. Eight subjects participated in an experiment to examine tracking performance, physiological parameters, and subjective tolerance when breathing the four following gas mixtures: air; 100% O2; 2.5% CO2 and 97.5% O2; and 3.5% CO2 and 96.5% O2. Tracking performance was not significantly different when breathing any of these four gas mixtures. Learning, which continued to occur throughout the experiment, was inhibited when the subjects were breathing the 3.5% CO2 mixture. When using either of the CO2 mixtures there was a significant increase in relative respiratory volume and a modest increase in systolic (11 mm Hg) and diastolic (6 mm Hg) blood pressure. One subject, when breathing 3.5% CO2, aborted the run after 12 minutes because of air hunger. GRA

METABOLIC CHANGES FOLLOWING ECCENTRIC EXERCISE IN TRAINED AND UNTRAINED MEN
W. J. Evans, C. N Meredith, J. G. Cannon, C. A. Dinarello, and W. R. Frontera 1986 24 p
(AD-A166521; AD-E900544; USARIEM-M-20/86) Avail: NTIS HC A02/MF A01 CSCL 06/16

The effects of one 45 minute bout of high intensity eccentric exercise (250 Watts) were studied in 4 male runners and 5 untrained men. Plasma creatine kinase (CK) activity in these runners was high ($p < 0.001$) than in the untrained men before exercise and peaked at 207 IU/ml one day after exercise, while in untrained men the maximum was 2143 IU/ml five days after exercise. Plasma interleukin-1 (IL-1) in the trained men was also higher ($p < 0.001$) than in the untrained men before exercise but did not significantly increase after exercise. In the untrained men, IL-1 was significantly elevated 3 hours after exercise ($p < 0.001$). In the untrained group only, 24-hour urines were collected before and after exercise while the men consumed a meat-free diet. Urinary 3-methylhistidine/creatinine in the untrained group rose significantly from 126 umol/g before exercise to 180 umol/g ten days after exercise. The results suggest that in untrained men, eccentric exercise leads to a metabolic response indicative of delayed muscle damage. Regularly performed long distance running was associated with chronically elevated plasma IL-1 levels and serum CK activities without acute increases after an eccentric exercise bout. GRA

INDUCED ERYTHROCYTHEMIA AND MAXIMAL AEROBIC POWER: AN EXAMINATION OF MODIFYING FACTORS
Michael N. Sawka, Andrew J. Young, Stephen R. Muza, Richard R. Gonzalez, and Kent B. Pandolf Apr. 1986 23 p
(AD-A166522; AD-E900544; USARIEM-M-22/86) Avail: NTIS HC A02/MF A01 CSCL 06/5

Induced erythrocythemia is associated with an increase in maximal oxygen uptake. Two factors which might influence inter-subject variability for this increase in maximal oxygen uptake are the magnitude of change in hemoglobin concentration and the individual's initial aerobic fitness. To examine these factors, we have obtained and combined individual data from our own research and three other studies which employed similar procedures. In each study freeze-preserved erythrocytes representing the product of two blood units were reinfused and maximal oxygen uptake was measured within 24 to 72-h after reinfusion. The 30 subjects had an initial aerobic power which ranged from 36 to 88 ml 02/dg/min. The combined results from these studies indicate that after erythrocyte reinfusion: 1) the increase in hemoglobin concentration is fairly homogeneous; 2) nearly all individuals demonstrate an increase in maximal oxygen uptake; 3) the magnitude of increase in hemoglobin concentration is not related to the magnitude of increase in maximal oxygen uptake is related to the individual's initial aerobic fitness. Individuals with an initial aerobic fitness between 50 to 64ml O2/kg/min experience approximately twice the increase in maximal oxygen uptake after erythrocyte reinfusion compared to individuals with lesser or greater fitness. GRA

N86-31213# Army Research Inst. of Environmental Medicine, Natick, Mass.
INTRINSIC ALTERATION OF THE REACTIVE PROPERTIES OF ARTERIES DURING HYPOTHERMIA
N. R. Bandick and Donald E. Roberts 21 Mar. 1986 23 p
(AD-A166523; AD-E900544; USARIEM-M-21/86) Avail: NTIS HC A02/MF A01 CSCL 06/5

This study compared the reactive and contractile properties of helical strips of femoral arteries taken from normothermic rabbits and rabbits that were anesthetized with pentobarbitol and cooled to 25 C at a rate of 7 C per hour. The purpose of this comparison was to see if intrinsic factors would alter the sensitivity and/or contractility of this vascular muscle to norepinephrine during whole body hypothermia. We found that, after two hours of in vivo hypothermia, the hypothermic derived tissue was from 10 to 100 times more sensitive to norepinephrine than the normothermic derived tissue. This augmented sensitivity continued while the tissue was in vitro for at least twelve hours. The dose-response curves of the hypothermic derived arteries were shifted to the left of the normothermic arteries resulting in a greater contractility at lower levels of agonist. Moreover, the normothermic tissue contracted slower than the hypothermic. The maximal tension developed by the strips was equivalent. This study has identified prolonged alterations of receptor sensitivities and contractility properties attributable to in vivo influences that can, in part, explain the disruptions of blood pressure during and following whold body hypothermia. PHYSICAL INTERACTION OF HUMANS AND ANIMALS WITH POWER-FREQUENCY ELECTRIC AND MAGNETIC FIELDS
W. T. Kaune Feb. 1986 11 p Presented at the IEEE Power Engineering Society Winter Meeting, New York, N.Y., 2 Feb. 1986

(Contract DE-AC06-76RL-01830)
(DE86-007734; PNL-SA-13716; CONF-860210-3) Avail: NTIS HC A02/MF A01

Research has been underway for more than 15 years investigating the biological and physical interactions of power-frequency electric fields coupled to humans and animals through the air dielectric around electric-power facilities. Currently, fairly detailed analyses can be made for homogeneous human- and animal-shaped models standing on ground while exposed to a vertical electric field. Some data are available for ungrounded exposure conditions. However, little is known about the effects of the nonuniform electrical properties of living tissues on induced-current distributions. Recently, interest has also developed in the interaction of humans and animals with power-frequency magnetic fields. Little data are available, and only simple estimates, using homogeneous ellipsodial models, can be made at present. Relatively simple calculational techniques are available, however, to analyze two- and three-dimensional models of humans and animals, and it can be expected that considerable progress will be made in the next few years. NEUROPHYSIOLOGICAL RESEARCH SUPPORTING THE INVESTIGATION OF ADAPTIVE NETWORK ARCHITECTURES Final Report, 1 Mar. 1983 - 28 Feb. 1985
Charles D. Woody 14 Aug. 1985 90 p
(Contract F49620-83-C-0077)
(AD-A166074; AFOSR-86-0083TR) Avail: NTIS HC A05/MF A01 CSCL 06/16

The investigators have shown that single cortical neurons adapt in such a way as to support learned behavior. What is particularly interesting is the indication that purposefully complex, molecular cascades exist at the level of single nerve cells to permit successful adaptions to occur. Successful adaptions are defined as: (a) producing the desired alteration of response to the appropriate input, (b) enduring over time, (c) not interfering with other adaptions occurring for another purpose in the same cell, and (d) not interfering with the main-throughput-message transfer property of the nerve cell. The result of these adaptations is to support the operation of a self-organizing information processing system with a high success: error ratio and excellent survivability in the face of substantial environmental change. Changes in the excitability of cortical neurons occur that lead to acquisition of the ability to perform specific motor tasks in response to specific auditory stimuli. Rates of acquiring this ability can be substantially increased by adding electrical stimulation of the hypothalamus associatively, to presentations of conventional conditioned and unconditioned stimuli. Part of this acceleration of learning the motor response may derive from recruitment of a new performance pathway, reflected in a longer transmission latency for movement production. A long range goal of the research is to understand how the system picks the right pathway. GRA

A DISCRETE CONTROL MODEL OF PLANT
Christine M. Mitchell *In its* Pilot Interaction With Automated Airborne Decision Making Systems Jul. 1985 31 p (For primary document see N86-31218 22-54)

Avail: NTIS HC A03/MF A01 CSCL 05H

A model of the PLANT system using discrete control modeling techniques developed by Miller is described. Discrete control models attempt to represent in a mathematical form how a human operator might decompose a complex system into simpler parts and how the control actions and system configuration are coordinated so that acceptable overall system performance is achieved. Basic questions include knowledge representation, information flow, and decision making in complex systems. The structure of the model is a general hierarchical/heterarchical scheme which structurally accounts for coordination and dynamic focus of attention. Mathematically, the discrete control model is defined in terms of a network of finite state systems. Specifically, the discrete control model accounts for how specific control actions are selected from information about the controlled system, the environment, and the context of the situation. The objective is to provide a plausible and empirically testable accounting and, if possible, explanation of control behavior. B.G.

DEVELOPMENT OF THERMOELECTRIC WATER HEATING-COOLING DEVICES Final Rept. Feb. - Oct. 1985
B. Mathipraksam 25 Oct. 1985 28 p
(Contracts DAAK60-85-C-0011; DA Proj. 1L1-62724-AH-99)
(AD-A166949; NATICK-TR-86/019) Avail: NTIS HC A03/MF A01 CSCL 13/1

A simple, safe, and reliable thermoelectric device for heating or cooling potable water for use in military vehicles was developed. The unit is capable of cooling water to 60 F in ambient temperatures up to 130 F and heating to 150 F in ambient temperatures of 40 F. Freezing/overheating and undervoltage protections are provided. The unit has also cooling/heating indicators, water ready indicators, and automatic switch off. A total of six units were built, tested, and delivered to U.S. Army Natick R&D Center. Author (GRA)

MAKING THE HUMAN-MACHINE INTERFACE RESPONSIVE TO MANY CLASSES OF USERS
R. W. Barnard 1986 15 p Presented at the DECUS Symposium, Dallas, Tex., 27 Apr. 1986
(Contract DE-AC04-76DP-00789)
(DE86-003453; CONF-860470-1) Avail: NTIS HC A02/MF A01

An applications program must be able to interact with users who have a range of familiarity with its operation. A novice user needs more guidance than an experienced one, and a rigid type of interaction (such as menus) will not meet the needs of all users. Frustrations with the program are reduced and productivity is increased by using a flexible means of response which matches the level of response to the needs of the user. This paper illustrates techniques to provide only as much guidance as the user requires. The methods discussed here permit the user to switch among three levels of guidance (none, short prompts, and menus) and to have context-sensitive help readily available. Because frequent users of a program will soon become quite proficient, supplying default answers and command entry shortcuts are also beneficial. These techniques have been used in a program which meets the needs of users who have all ranges of proficiency. DOE

(Contract DE-AC07-76ID-01570)
(DE86-008181; SSDC-34) Avail: NTIS HC A03/MF A01

Models and concepts for analyzing the human element in working programs and systems are introduced. The method of attack is a functional one based on analysis of the work to be done (job-task analysis). Based on the results of the job-task analysis, psychological and physiological requirements and criteria can be defined for the system. DOE

The impact of the human and human reliability on the results of probabilistic risk assessment studies is discussed in terms of some of the standard models used in risk quantification. Three levels of analysis are considered: (1) identification of areas where the human affects the operational risks; (2) rough scaling and quantification of the effect of the human on operational outcome; and (3) complete quantification of the risks including consideration of human reliability. (DE86-008183; EGG-SSDC-31) Avail: NTIS HC A03/MF A01

The paper presents a task analysis form for the organization of task analysis efforts. In terms of the form, task descriptions for use in task analysis data collection are given, and detailed definitions of 35 task analysis categories are offered. The categories include important aspects of task performance, consequences, and feedback, as well as aspects of training and knowledge requirements. Methods behind the derivations of tasks and subtasks, and category analysis are explained. Aspects of data applications concerning who and how are discussed. Task analysis can be used in the development of behavioral learning objectives and instructional strategies. Action verbs are often used in category analysis and human capabilities identification. Curriculum and tests may be developed by analyzing what people do and need in their jobs. The process of task analysis is a useful tool in the analysis and improvement of human job performance. DOE

Evaluating a system to determine if it has the right people working using the right procedures and management controls with the right hardware at all times is the facet of human factors discussed in this manual. The following areas of concern are specifically addressed: (1) the selection process must be proper to select qualified workers who are given proper training for the work and whose skills are maintained; (2) a proper behavioral climate must be established at the work station; (3) all task assignments must contain elements of instruction and training; and (4) all supporting systems must interact with the human to ensure that the work can be completed. All of these areas of concern can be successfully completed using the existing company organization by following the considerations presented in this document and maintaining proper interfaces between the different branches of the company. The Seventeenth Symposium on the Interface of Computer Sciences and Statistics was held in the Radisson Plaza Hotel, Lexington, Kentucky on March 17-19, 1985. The sessions encompassed a broad range of topics. A number of sessions dealt with computational methods for traditional statistical areas. These included time series, nonlinear models, repeated measures data analysis, and categorical data analysis. Some sessions were in the relatively new areas of statistics such as artificial intelligence, the metadata of computational processes, statistical computing languages, and statistical workstations. There were also sessions in numerical methods, density estimation, teaching of statistical computing, statistical and mathematical software and graphics. During one session the entire audience participated in a round table discussion on the performance of statisticians with statistical software. Written versions of nearly all these papers are in this volume. GRA

ADA (TRADE NAME) COMPILER VALIDATION SUMMARY REPORT: AFATL ADA CROSS-COMPILER VERSION 1.0, CDC CYBER HOST/ZILOG Z8002 TARGET Final Report, 6 Dec. 1985 - 6 Dec. 1986
6 Dec. 1985 52 p
(Contract F33600-84-D-0280)
(AD-A166212) Avail: NTIS HC A04/MF A01 CSCL 09/2

The purpose of this Validation Summary Report is to present the results and conclusions of performing standardized tests on the Air Force Armament Laboratory (AFATL) Ada Compiler, developed by Florida State University (FSU). The AFATL Ada Compiler (Version 1.0) is hosted on the CDC Cyber 170/760 and targeted to the Zilog Z8002 Development Module. The suite of tests known as the Ada Compiler Validation Capability (ACVC), Version 1.6, was used. The purpose of the testing is to ensure that the compiler properly implements legal language constructs and that it identifies, rejects from processing, and labels illegal language constructs. The testing also identifies implementation-dependent behavior permitted by the standard. Six classes of tests are used. These tests are designed to perform checks at compile time, during execution, and at link time. GRA

ADA (TRADE NAME) COMPLIER VALIDATION SUMMARY REPORT: VERDIX ADA DEVELOPMENT SYSTEM, VERSION 5.2 FOR THE SEQUENT BALANCE UNDER DYNIX, RELEASE 1.3.2
15 Nov. 1985 79 p
(AD-A167231; AVF-VSR-15.0286) Avail: NTIS HC A05/MF A01 CSCL 09/2
The Validation Summary Report describes how an Ada compiler conforms to the language standard. This report explains all technical terms used within it and thoroughly reports the Ada Compiler Validation Capability test results. Ada compilers must be written according to the language specification as given in ANSI/MIL-STD-1815A Ada. All implementation-defined features must be included for the compiler to conform to the Standard. Following the guidelines of the Standard ensures continuity between compilers. That is, the entire Standard must be implemented, and nothing can be implemented that is not in the standard. Even though all validated Ada compilers conform to the Standard, it must be understood that some differences do exist between implementations. ANSI/MIL-STD-1815A permits some implementation dependencies--e.g., the maximum length of identifiers, the maximum values of integer types, etc. These implementation-dependent features limit the portability of programs between compilers. Other differences between compilers are due to limitations imposed on a compiler by the operating system and by the hardware. All of these dependencies are given in the report. GRA

EXPECTED PERFORMANCE OF m-SOLUTION BACKTRACKING Final Report
David M. Nicol Aug. 1986 26 p Submitted for publication
(Contract NAS1-18107)
(NASA-CR-178162; NAS 1.26:178162; ICASE-86-55) Avail: NTIS HC A03/MF A01 CSCL 09B
This paper derives upper bounds on the expected number of search tree nodes visited during an m-solution backtracking search, a search which terminates after some preselected number m problem solutions are found. The search behavior is assumed to have a general probabilistic structure. The results are stated in terms of node expansion and contraction. A visited search tree node is said to be expanding if the mean number of its children visited by the search exceeds 1 and is contracting otherwise. It is shown that if every node expands, or if every node contracts, then the number of search tree nodes visited by a search has an upper bound which is linear in the depth of the tree, in the mean number of children a node has, and in the number of solutions sought. Also derived are bounds linear in the depth of the tree in some situations where an upper portion of the tree contracts (expands), while the lower portion expands (contracts). While previous analyses of 1-solution backtracking have concluded that the expected performance is always linear in the tree depth, the model allows superlinear expected performance. Author

GEOMETERIAL DESCRIPTION FOR A PROPOSED AEROASSIST FLIGHT EXPERIMENT VEHICLE
F. McNeil Cheatwood, Fred J. DeJarnette (North Carolina State Univ., Raleigh.), and H. Harris Hamilton, II Jul. 1986 38 p
(NASA-TM-87714; NAS 1.15:87714) Avail: NTIS HC A03/MF A01 CSCL 09B
One geometry currently under consideration for the Aeroassist Flight Experiment (AFE) vehicle is composed of several segments of simple general conics: an ellipsoidal nose tangent to an elliptical cone and a base skirt with the base plane raked relative to the body axis. An analytic representation for the body coordinates and first and second partial derivatives of this configuration has been developed. Equations are given which define the body radius and partial derivatives for a prescribed axial and circumferential position on the vehicle. The results for a sample case are tabulated and presented graphically. Author

SYNTHETIC SEISMOGRAMS, GRAPHIC SOFTWARE AND COMPUTER FACILITIES Final Report, Sep. 1984 - May 1985
David W. Simpson May 1985 12 p
(Contract F19628-84-K-0046)
(AD-A166517; AFGL-TR-85-0306) Avail: NTIS HC A02/MF A01 CSCL 09/2

A SUN-1/100U graphic workstation, which was installed in the Seismology Computing Lab. at Lamont-Doherty, has become the centerpiece of a digital waveform processing and analysis facility. A local area network (LAN) comprising Ethernet/TCP-IP protocols connects the SUN-1 with the Observatory's pre-existing VAX 11/780 and PDP 11/70 installations. The operating systems on the VAX (VMS) and the PDP (Unix bsd 2.9) were updated and modified to provide support for the full set of Ethernet utilities. The Ethernet LAN is undergoing start-up testing and soon will be fully operational. While the SUN-1 offers only rudimentary computational power, its state-of-the-art graphic capabilities have enabled us to develop a quick-look digital data-handling facility. Once the network is fully operational, the resources of the Observatory's other computer laboratories will become available to the SUN-1. The VAX will be used as the network file-server, peripheral handler, and computational node, while the SUN will be used for the graphic analysis of waveforms and digital images. Preliminary experiments with the network suggest that powerful graphic workstations integrated vertically with file-servers, computational nodes, and supercomputer communication capability provide a flexible, powerful, and productive computational environment for research in seismology and tectonophysics. ABSTRACTIONS FOR FAULT TOLERANCE IN DISTRIBUTED SYSTEMS Interim Report
Fred B. Schneider Apr. 1986 9 p
(Contract N00014-86-K-0092)
(AD-A166549; CU-CSD-TR-86-745) Avail: NTIS HC A02/MF A01 CSCL 09/2

This paper describes abstractions that are useful in implementing fault-tolerant and distributed systems. The same abstractions serve both fault tolerance and distribution, supporting our belief that the two concerns are not separable. The abstractions we present have a somewhat different flavor from abstractions prevalent in sequential and concurrent programming, which encapsulate state information and/or provide operations to manipulate that state (e.g., a stack or a monitor). Our abstractions are best thought of as properties of protocols or control. Section 2 describes abstractions of processors that can fail and section 3 reviews some fundamentals for coping with failures. Section 4 discusses the state machine approach, a general way to construct fault-tolerant distributed computing services. The state machine approach motivates two abstractions: Agreement and Order. Section 5 discusses a second approach for constructing a fault-tolerant computing service and this motivates two more abstractions: Failure Detection and Stable Storage. Implementing abstractions by exploiting hardware is discussed in section 6. Section 7 discusses related work. GRA

A QUANTITATIVE CHARACTERIZATION OF CONTROL FLOW CONTEXT: SOFTWARE MEASURES FOR PROGRAMMING ENVIRONMENTS M.S. Thesis
James W. Howatt 1985 146 p
(AD-A166762; AFIT/CI/NR-86-37D) Avail: NTIS HC A07/MF A01 CSCL 09/2

A review of published measures of control flow complexity in programs reveals three major deficiencies; loss of information, lack of specificity, and lack of analytical support. A new approach is used to characterize the control structure of a program, with the aim of defining properties and measures of control flow that can be of immediate use to programmers, regardless of their utility as complexity measures. Mathematical rigor and analytical evaluation techniques are used to define a set of properties of control structure and a corresponding vector of measures. Instead of defining the properties and measures for an entire flowgraph, they are defined at the node level, reflecting the control flow surrounding each node in a flowgraph. The properties and their measures reflect the following characteristics of control flow; nesting, iteration, structuredness, and predecessors. Algorithms for computing the properties and their measures are presented. An assessment of the computational complexity of the algorithms shows that they are feasible programming environment tools. A finite path set, representing all possible execution sequences, is evaluated as a characterizing property. Desired characteristics of the path set are defined and used to evaluate four published path subset criteria. Those criteria are shown to be deficient, so a fifth criterion is defined. However, the path set satisfying this fifth criterion is shown to be too large to be of practical use to a programmer. DOE

N86-31244# Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.
SOLVING MULTI-STATE VARIABLE DYNAMIC PROGRAMMING MODELS USING VECTOR PROCESSING M.S. Thesis
Stuart W. Stopkey Dec. 1985 111 p
(AD-A166763; AFIT/CI/NR-86-45T) Avail: NTIS HC A06/MF A01 CSCL 09/2

One of the classical allocation models is known as the pallet loading problem. It consists of optimally loading parcels with various

weight and volume parameters on a pallet. This pallet has weight and volume limits which constrain the amount of parcels that can be loaded. An optimal load is that combination of parcels which maximized the summed utilities of all parcels that are loaded. The pallet loading problem can ge generalized to a 2-state variable (weight and volume) Dynamic Programming model. However, the problem can be solved by other methods. In the past, these other methods were preferred due to the difficulty of Dynamic Programming in solving problems of more than one state variable. With the advent of new computer technology in the form of vector processing, that difficulty can be overcome. The efficient column manipulating nature of vector processing is a perfect match for the column nature of the Dynamic Programming problem formulation. Based upon the algorithm developed using the ideas for vector processing, Dynamic Programming can be considered a very efficient solution technique to the 2-state variable problem. Using the vector processing capability of the ETA Systems supplied CDC Cyber 205, 2-state variable problems too large to be solved previously using DP can now be solved with small computational times. Also, an analysis of the results show that computation time increases linearly as the problem parameters are increased, not exponentially. Author (GRA)

This report covers the period from October 1, 1985 through March 31, 1986. The research discussed here is described in more detail in several published and unpublished reports cited below. During this period, the installation of the central computing machine for the MIT CAF work, known as CAF and all the necessary software was substantially completed. The machine is a VAX 11/785. It has a large cadre of users. A rudimentary CAF system, known as CAFE (Computer-Aided Fabrication Environment), has been implemented. So far this system provides an electronic personal notebook, machine instructions, and equipment status reports. Four fabrication facilities are being served, at least in part. Even though crude, CAFE has been in constant use. The requirements of a scheduling program are being studied. One surprising result so far is the importance of setup operations in scheduling some equipment. Two new process-simulation modules have been developed. One is for a focused ion beam operation used for implanting, and the other is for nonuniform oxidation. Improved models were inserted into the simulators SUPREM and MINIMOS. GRA

LSSOL (VERSION 1.0): A FORTRAN PACKAGE FOR CONSTRAINED LINEAR LEAST-SQUARES AND CONVEX QUADRATIC PROGRAMMING. USER'S GUIDE
Philip E. Gill, Sven J. Hammarling, Walter Murray, Michael A. Saunders, and Margaret H. Wright Jan. 1986 44 p
(Contracts N00014-85-K-0343; DAAG29-84-K-0156; DE-AA03-76SF-00326; DE-AS03-76ER-72018)
(AD-A166945; SOL-86-1) Avail: NTIS HC A03/MF A01 CSCL 09/2

This report forms the user's guide for Version 1.0 of LSSOL, a set of Fortran 77 subroutines for linearly constrained linear least-squares and convex quadratic programming. The method of LSSOL is of the two-phase, active-set type, and is related to the method used in the package SOL/QPSOL. Two main features of LSSOL are its exploitation of convexity and treatment of singularity. LSSOL may also be used for linear programming, and to find a feasible point with respect to a set of linear inequality constraints. LSSOL treats all matrices as dense, and hence is not intended for large sparse problems. Author (GRA)

Staggering amounts of commercial software are marketed to fulfill needs from the PC explosion. Unfortunately, such software is trivial to duplicate. From the vendors' viewpoint a way to protect profit is needed. Typically, they have resorted to various schemes that attempt to inhibit the duplication process. Although protection of future profit is important, so is protection against current loss. Commercial and business related software must be adequately protected least data be stolen or manipulated. However, more important than any of these classes is protection of government computer resources, especially classified and operational software and data. Loss of control in this realm could be detrimental to national security. This paper addresses current technologies employed in protection schemes: signatures (magnetic and physical) on floppy disks, Software Analysis Denial (SAD), Hardware Security Devices (HSD), and Technology Denial Concepts (TDC) are presented, with an emphasis on SAD. Advantages and disadvantages of these schemes will be clarified. DOE

SEMICONDUCTOR DEVICE MODELING ON A WORKSTATION
C. Diegert Sep. 1985 15 p Presented at the Workshop on Large Scale Computational Device Modeling, Chicago, Ill., 18 Apr. 1985
(Contract DE-AC04-76DP-00789)
(DE86-001125; SAND-85-0844; CONF-8504207-1) Avail: NTIS HC A02/MF A01

We choose to move from large mainframe computers to workstations to gain the interactive graphics we need to prepare and to analyze semiconductor device modeling problems. Given this much on a workstation, it is convenient to attempt to solve the entire problem there. We find that a top-of-the-line Apollo 660 workstation, with bit-slice processor, pipelined arithmetic processor, and 4 megabytes of real memory, is surprisingly effective in finding solutions when running the Pisces II device modeling code. In our experiment we find where the workstation bogs down when running these problems. We both analyze the Pisces CPU time log and we sample the executing program to accumulate a histogram of execution time as distributed over the source code. Results suggest how Pisces could be adapted to solve somewhat larger problems entirely on the workstation. Evolution of a trusted derivative of Pisces, to be used on supercomputers without interactivity, is suggested to complement our success with Pisces on workstations. DOE

IN-HOUSE CAD TRAINING: A REALISTIC APPROACH
Tony Whitus 10 Apr. 1986 11 p Presented at the American Institute for Design and Drafting Convention, Hollywood, Fla., 7 Apr. 1986
(Contract DE-AC05-84OT-21400)
(DE86-008926; K/D-5697; CONF-8604150-1) Avail: NTIS HC A02/MF A01

The need for industry to retrain its engineering personnel to use a CAD system can be demanding, as well as frustrating. In fact, the larger and more diverse the organization, the more demanding these requirements may be. It should be noted that in preparing for CAD implementation, the training needs and requirements are often underestimated. Additionally, most engineering organizations implementing CAD do not have personnel experienced in developing training programs or in teaching manipulative skills. This text describes the evolution of the in-house CADAM basic training program at Martin Marietta Energy Systems, Inc. Rather than emphasize the theoretical aspects of designing such a program, the paper will concentrate on the practical, more realistic aspects of program development. The paper should serve as a guide to others desiring to develop a similar program. This paper first presents a brief look at factors concerning retraining the experienced engineering employee. Then, the actual planning, organization, structuring, implementation, and evaluation of the training program, as well as possible future directions are presented. Finally, the paper offers advice to those planning similar in-house CAD training programs. DOE

Computer-Aided Design (CAD) requires a larger commitment of resources within an organization. It is imperative that methods be developed and implemented which will aid in the efficient management of CAD systems. The purpose of this paper is to discuss one of the methods by which Martin Marietta Energy Systems is addressing these management problems using utilization data which are available from the CAD host computer. Also, to be examined are the integration of these data with related data in applications databases and their use for resource management, equipment management, human resource management, cost tracking, and productivity analysis. HYPERCUBE ALGORITHMS AND IMPLEMENTATIONS
O. A. McBryan and E. F. VandeVelde Feb. 1986 118 p Presented at the 2nd Society for Industrial and Applied Mathematics Conference on Parallel Computing, Norfolk Va., 18 Nov. 1985
(Contract DE-AC02-76ER-03077)
(DE86-007439; DOE/ER-03077/271; CONF-8511169-1) Avail: NTIS HC A06/MF A01

Parallel algorithms are presented for important components of Computational Fluid Dynamics algorithms along with implementations on hypercube computers. Elliptic equations with 1.6 million unknowns and hyperbolic equations with 4 million unknowns have been solved using 128 processors. For elliptic equations, a parallel Preconditioned Conjugate Gradient method is described which has been used to solve pressure equations discretized with high-order finite elements on irregular grids. A parallel Full Multigrid Method and a parallel Fast Poisson Solver are also presented. Hyperbolic Conservation Laws have been discretized with parallel versions of finite difference methods and with the Random Choice Method. The performance of these algorithms is analyzed in terms of machine efficiency, communication time, bottlenecks and software development costs. A key aspect of this work is the development of a library of parallel operators for distributed vectors and matrices, efficient for both full and sparse data. The implementation of these operators on hypercubes is described along with measurements of communication effects. Using the library the PDE algorithms mentioned above have been implemented on both serial computers and on hypercubes without any code modification. All inter-process communication is hidden in library routines. A general parallel computer simulator is described along with its use in the development of the algorithms. DOE

FULLY PARALLEL ALGORITHM FOR THE SYMMETRIC EIGENVALUE PROBLEM
J. J. Dongarra and D. C. Sorensen Jan. 1986 25 p Presented at the 2nd Society for Industrial and Applied Mathematics Conference on Parallel Computing, Norfolk Va., 18 Nov. 1985
(Contracts W-31-109-eng-38; DE-AC05-84OR-21400; DE-FG02-85ER-25001)
(DE86-007553; ANL/MCS-TM-62; CONF-8511169-2) Avail: NTIS HC A02/MF A01

In this paper we present a parallel algorithm for the symmetric algebraic eigenvalue problem. The algorithm is based upon a divide and conquer scheme suggested by Cuppen for computing the eigensystem of a symmetric tridiagonal matrix. We extend this idea to obtain a parallel algorithm that retains a number of active parallel processes that is greater than or equal to the initial number throughout the course of the computation. The algorithm does not suffer from loss of parallelism associated with a typical divide and conquer dependency graph. We give a new deflation technique which together with a robust root finding technique will assure computation of an eigensystem to full accuracy in the residuals and in the orthogonality of eigenvectors. A brief analysis of the numerical properties and sensitivity to round off error is presented to indicate where numerical difficulties may occur. We also suggest a way to combine the tridiagonal method with a parallelization of the initial reduction to tridiagonal form to obtain a fully parallel algorithm for the symmetric eigenvalue problems. The algorithm is able to exploit parallelism at all levels of the computation and is well suited to a variety of architectures. We also touch upon implementation and portability issues with particular attention paid to the role of the algorithm as a library subroutine. We discuss a technique used to implement the algorithm which allows the code to be transported to a significant variety of existing parallel computers. Computational results are presented for several machines to demonstrate this. These results are very encouraging with respect to both accuracy and speedup. A surprising result is that the parallel algorithm, even when run in serial mode, can be significantly faster than the best sequential algorithm on large problems, and is effective on moderate size problems when run in serial mode. PASCAL FOR ENGINEERS: A COURSE INCLUDING OMEGASOF PASCAL FOR MICROCOMPUTERS
L. A. Tausch 16 Sep. 1985 133 p
(DE86-701701; CERN-85-14) Avail: NTIS (US Sales Only) HC A07/MF A01

These are the notes of a PASCAL course for controls engineers at CERN. The course starts with Standard Pascal and includes OMEGASOFT Pascal, a powerful extension of Pascal towards real-time and systems applications. It demonstrates how a language such as Pascal, with adequate extensions for systems programming and embedded microprocessor-driven systems, can substantially increase the productivity of programmers and the reliability of their products. Also enhanced will be the legibility of the programs and their maintainability, since programming in Pascal automatically leads to autodocumentation. Simple examples show how OMEGASOFT-PASCAL can be used for efficient programming of embedded systems for real-time data acquisition and control using the MC6809 microprocessor. DOE

DEVELOPMENT AND EVALUATION OF DOTTOR, A COMPUTER CODE TO COUPLE TWO-DIMENSIONAL TO THREE-DIMENSIONAL DISCRETE ORDINATES CALCULATIONS
J. L. Thompson, M. B. Emmett, and H. L. Dodds, Jr. Apr. 1986 83 p
(Contract DE-AC05-84OR-21400)
(DE86-010081; ORNL/TM-9919) Avail: NTIS HC A05/MF A01

A method has been developed to couple two-dimensional (d-D) to three-dimensional (3-D) discrete ordinates transport calculations. This method is useful for problems in which a 3-D Cartesian (X-Y-Z geometry) region of interest is very far from a point source. A 3-D solution from the source including the region of interest is prohibited due to the large computing cost of such calculations. The problem is solved by first performing a 2-D discrete ordinates calculation from the source past the region of interest. The results of the 2-D calculations are transformed into a boundary condition on the surface of the 3-D region of interest. This transformation or coupling method is developed and implemented in the DOTTOR computer code. The boundary condition is then used for a subsequent 3-D discrete ordinates calculation in the region of interest. Simple test problems were used to evaluate the accuracy and speed (i.e., computing cost) of the DOTTOR code. The evaluation indicates that the DOTTOR code produces accurate results with acceptable computing costs. The algorithm chosen showed a significant speed advantage over others tested when applied to large problems. DOE

CONFIDENCE ELLIPSE RESEARCH SOFTWARE (EAAF) Final Report
Janet Myhre, Will Duquette, and Daniel Hockman 8 Aug. 1985 48 p Prepared in cooperation with Mathematical AnalysisResearch Corp., Claremont, Calif.
(Contract NAS7-918)
(NASA-CR-176983; JPL-D-2786; NAS 1.26:176983; AD-A166479; TM-6) Avail: NTIS HC A03/MF A01 CSCL 09/2

This document describes three programs used by MARC in studying and testing confidence ellipses. Genellipse is an ellipse graphing and combination program. It allows the user to specify up to twenty confidence ellipses, combine ellipses, graph ellipses, and test ellipses for combination. It has been used primarily to explore the geometric properties of the combination method, but has also been used to create figures for a number of other reports. Ellsim is a 'confidence ellipse simulation' program. It has been used to explore the robustness and properties of the statistical test (which is used to decide whether or not to combine two ellipses). In it, two normal data distributions are specified, corresponding to two emitters. Confidence ellipses are generated, tested, and combined, and various descriptive statistics are compiled. In addition, there is a routine to calculate the power of the statistical test in certain cases. Ellipstuff is an 'ellipse routine library,' which contains a large number of routines to make working with ellipses easier. As such, both Genellipse and Ellsim contain all these routines, but they are all listed separately. If more programs need to be written, these are the routines on which to build. They contain all of these routines, but they are also listed separately. If more programs need to be written, these are the routines to build them with. GRA

OPTIMAL PARTITIONING OF RANDOM PROGRAMS ACROSS TWO PROCESSORS Final Report
David M. Nicol Aug. 1986 27 p Submitted for publication
(Contract NAS1-18107)
(NASA-CR-178159; ICASE-86-53; NAS 1.26:178159) Avail: NTIS HC A03/MF A01 CSCL 09B

The optimal partitioning of random distributed programs is discussed. It is concluded that the optimal partitioning of a homogeneous random program over a homogeneous distributed system either assigns all modules to a single processor, or distributes the modules as evenly as possible among all processors. The analysis rests heavily on the approximation which equates the expected maximum of a set of independent random variables with the set's maximum expectation. The results are strengthened by providing an approximation-free proof of this result for two processors under general conditions on the module execution time distribution. It is also shown that use of this approximation causes two of the previous central results to be false. Author

(AD-A166663; AD-E500758; LIDS-P-1543) Avail: NTIS HC A02/MF A01 CSCL 09/2

An efficient algorithm is presented which allows each node in a computer network to maintain a correct view of the network topology despite link and node failures. Reliability is achieved without transmitting any information other than the operational status of links. Messages are only sent in response to topological changes: periodic retransmission is not required. The algorithm is extended to allow nodes to maintain congestion measurements used in making routing decisions. Author (GRA)

Two methods are used to speed up the execution of a computational task. One is new technology development and the other is the exploitation of parallelism in the computation. To take an advantage of the parallelism in a task requires the utilization of parallel computer architectures. At a certain high level of abstraction a parallel computer system is represented as a graph where the nodes represent processors, memories, or other devices, and the edges represent the communication links. In this thesis the following problems of parallel processing are studied. First is a theoretical study of topological properties of interconnection networks. Second is a case study of a network design for a real-time system. Lastly, the use of SIMD(Single Instruction Stream Multiple Data Stream) networks for performing shuffles is discussed. A general model that can be used to describe networks and systems with arbitrary topologies is developed. Based upon the morphism of groups, the concept of morphism of systems is developed. The morphism of systems is called quasimorphism and allows a method of comparison between topologically arbitrary parallel computer systems. The quasimorphism is used to study the emulation of one system by another. GRA

CONTROL DESIGN FOR ROBUST STABILITY IN LINEAR REGULATORS: APPLICATION TO AEROSPACE FLIGHT CONTROL Final Report, 1 Jun 1985 - 17 Jul. 1986
Rama K. Yedavalli 1986 63 p
(Grant NAG1-578)
(NASA-CR-176858; NAS 1.26:176858) Avail: NTIS HC A04/MF A01 CSCL 09B

Time domain stability robustness analysis and design for linear multivariable uncertain systems with bounded uncertainties is the central theme of the research. After reviewing the recently developed upper bounds on the linear elemental (structured), time varying perturbation of an asymptotically stable linear time invariant regulator, it is shown that it is possible to further improve these bounds by employing state transformations. Then introducing a quantitative measure called the stability robustness index, a state feedback conrol design algorithm is presented for a general linear regulator problem and then specialized to the case of modal systems as well as matched systems. The extension of the algorithm to stochastic systems with Kalman filter as the state estimator is presented. Finally an algorithm for robust dynamic compensator design is presented using Parameter Optimization (PO) procedure. Applications in a aircraft control and flexible structure control are presented along with a comparison with other existing methods. Author

THE COMPUTATIONAL COMPLEXITY OF TWO-LEVEL MORPHOLOGY
G. Edward Barton, Jr. Nov. 1985 39 p Presented at the Workshop on Finite-State Morphology, Stanford, Calif., 29-30 Jul. 1985
(Contract N00014-80-C-0505)
(AD-A165991; AI-M-856) Avail: NTIS HC A03/MF A01 CSCL 05/7

Morphological analysis requires knowledge of the stems, affixes, combinatory patterns, and spelling-change processes of a natural language. The computational difficulty of the task can be clarified by investigating the computational characteristics of specific models of morphological processing. The use of finite-state

machinery in the two-level model by Kimmo Kosken-niemi gives it the appearance of computational efficiency, but closer examination shows the model does not guarantee efficient processing. Reductions of the satisfiability problem show that finding the proper lexical-surface correspondence in a two-level generation or recognition problem can be computationally difficult. However, another source of complexity in the existing algorithms can be sharply reduced by changing the implementation of the dictionary component. A merged dictionary with bit-vectors reduces the numbers of choices among alternative dictionary subdivisions by allowing several subdivisions to be searched at once.

APPLICATION OF YBJ (YOULA, BONGIORNO AND JABR) CONTROL THEORY TO THE INITIAL RESPONSE PROBLEM M.S. Thesis
Paul J. Warden May 1986 110 p
(AD-A166756; AFIT/CI/NR-86-46T) Avail: NTIS HC A06/MF A01 CSCL 09/3

In this thesis, two theorems were derived. First, the Initial Response Theorem describes the necessary and sufficient conditions for a series compensator for a feedback control system to simultaneously stabilize the system and cause the initial system response to achieve prescribed constraints. A single input-single output, continuous time linear system is considered, with a delta function driving any rational transfer function in the s-domain being the system input. Design constraints can be placed on the initial response value, and on any of the derivatives (from the right) of the initial response. Second, the Initial Response Parameterization gives a parameterization of the complete set of compensators that will meet the given constraints whenever the conditions of the Initial Response Theorem are met. The area of Youla, Bongiorno and Jabr (YBJ) Control Theory was used for the derivations, but first required a system transformation to convert the initial value problem to one of stability. FILTERING AND CONTROL FOR WIDE BANDWIDTH NOISE DRIVEN SYSTEMS Interim Report
H. J. Kushner and W. Runggaldier Jan. 1986 60 p
(Contracts DAAG29-84-K-0082; N00014-83-K-0542; DA Proj. 230-4; Grant AF-AFOSR-0116-81)
(AD-A166964; LCDS-86-8; AFOSR-86-0258TR) Avail: NTIS HC A04/MF A01 CSCL 09/2

Much of modern stochastic control theory uses ideal white noise driven models (Ito equations). If the observed data is corrupted by noise, then the noise is usually assumed to be white Gaussian. Typically, if the underlying models are linear, one uses a Kalman-Bucy filter to get an estimate of the state, and then bases the control on this estimate. In practice, the noises are rarely white, and the reference signals and the systems are only approximations in some sense to a diffusion. Never-the-less, owing to lack of viable alternatives, one still uses the Kalman-Bucy filter, etc. Then the estimates are not optimal and, indeed, might be quite far from being optimal, and similarly for the corresponding control. (Examples are given to illustrate this.) The sense in which the estimates and/or control is useful need to be examined in order to justify the use of the commonly used procedure. The issue is much deeper than mere robustness in the usual sense, since basic questions of interpretation of the results are involved. The paper deals with these questions. For the filtering problem where the signal is a near Gauss-Markov process and the observation noise wide band, it is shown that the usual method is nearly optimal with respect to a class of alternative data processors. This alternative class is rather natural and includes the data processors which one would normally want to use. GRA

INTELLIGENT INTERFACE FOR DESIGN AND SIMULATION
W. Draisin and E. Peter 1986 8 p Presented at the Expert Database Systems Conference, Charleston, S.C., 1 Apr. 1986
(Contract W-7405-eng-36)
(DE86-000762; LA-UR-3275; CONF-860458-1) Avail: NTIS HC A02/MF A01

We are developing a system composed of intelligent interfaces, expert systems, and databases that uses artificial intelligence techniques to simplify the use of large simulation codes and to help design complicated physical devices. The simulation codes are used in analyzing and designing weapons, and the devices are themselves parts of weapon systems. From a designer's point of view, the simulation process is the same no matter what is being simulated. In the course of developing two intelligent interfaces for the design of nuclear weapons, we have found that data-driven programming is a useful technique for implementing an open-ended user interface to assist the designer. We discuss the simulation process as it is done now and as it could be done with intelligent interfaces. We then discuss the use of data-driven programming in a database environment to support an interface for an arbitrary number of simulation codes. DOE

AUTOMATED REASONING: BASIC RESEARCH PROBLEMS
L. Wos Mar. 1986 40 p
(Contract W-31-109-eng-38)
(DE86-009214; ANL/MCS-TM-67) Avail: NTIS HC A03/MF A01

In this paper, we present some of the open research problems in the field of automated reasoning. By collecting these problems in one place, we intend to stimulate research and thus reduce the time required to reach one of the primary objectives of the field. That objective is to design and implement a computer program that functions as a high-level automated reasoning assistant. This paper is intended for new researchers as well as those who have been active in the field. We therefore include an overview of automated reasoning itself, touching on the basic elements, various examples and some of its applications. The existence of single automated reasoning programs that have provided valuable assistance in answering open questions in mathematics and logic, designing superior circuits, validating existing circuit designs, and proving properties of computer programs establishes the usefulness and versatility of such programs. The degree of assistance future automated reasoning programs will offer depends on which of the open problems cited in this paper are solved. DOE

REAL-TIME PRODUCTION SYSTEM FOR INTELLIGENT ROBOT CONTROL
G. deSaussure, D. Kammer, and C. R. Weisbin 1986 13 p Presented at the National Conference on Artificial Intelligence, Philadelphia, Pa., 11 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008501; CONF-860848-1) Avail: NTIS HC A02/MF A01

The use of a production system for the control of an autonomous robot presents several attractive features: the explicitness and homogeneity of the knowledge representation facilitates explaining, verifying and modifying the rules which determine the robot's behavior; it also permits the intremental extension of the domain of competence. However, real-time operation poses a number of challenges due to the dynamic nature of the data and because the system must frequently deal with a large knowledge base in a limited time. An implementation of a knowledge base is discussed where a large commercial real-time expert system originally designed for industrial process diagnostic was adapted to the control of an autonomous mobile robot planning, executing and monitoring a set of navigational tasks. OPTIMUM PARAMETER IDENTIFICATION IN A DYNAMIC SYSTEM DESCRIBED BY A STOCHASTIC LINEAR DIFFERENTIAL EQUATION WITH CONTROL FUNCTIONS Ph.D. Thesis [IDENTIFICATION OPTIMALE DES PARAMETRES D'UN SYSTEME DYNAMIQUE REGI PAR UNE EQUATION DIFFERENTIELLE STOCHASTIQUE LINEAIRE COMMANDEE]

Nadia Brahimi 1985 140 p In FRENCH
(ESA-86-97280) Avail: NTIS HC A07/MF A01

The estimation of parameters along a system variation in a given time interval for a chosen strategy and the determination of the optimal control in the sense of obtaining criteria linked to the Fisher information matrix to improve the quality of the estimation are considered. Discrete time and continuous time strategies are studied. In the first case the Girsanov theorem justifies the Markov chain approach. It is shown that the maximum likelihood estimator is consistent with a normal asymptotic function. The continuous case is treated by approximations given by the limits of series of processes. The second problem remains unsolved. The reasons are discussed. ESA

ON THE COHERENCE AMONG THE MULTITUDE OF SYSTEM IDENTIFICATION METHODS **c65**
P. Eykhoff and A. J. W. vandenBoom *In its* System Identification. Mini Course Jul. 1984 p 3-24 Presented at 6th IFAC Symposium on Identification and System Parameter Estimation, Washington, 1982 (For primary document see N86-31274 22-64)
Avail: NTIS HC A03/MF A01

The choice of template functions/series that span function spaces of process input-output in system identification is discussed. Based on the template functions/series choice, estimation methods, as well as their properties, can be split into three classes, depending on whether the template functions and observations are deterministic or stochastic. Depending on the class to which they belong, the properties of the estimators range from complete statistical information to only limit-measures for the estimation accuracy attainable. The Cramer-Rao relation and the information matrix play an essential role. Linearity, pseudo-linearity and nonlinearity-in-the-parameters of the models used are related to such fundamental aspects. ESA

A GENERALIZED DIAGRAM FOR VARIOUS PARAMETER ESTIMATION METHODS; THE COHERENCE IN PSEUDO-LINEAR REGRESSION SCHEMES **c65**
P. Eykhoff and A. J. W. vandenBoom *In its* System Identification. Mini Course Jul. 1984 p 25-37 (For primary document see N86-31274 22-64)
Avail: NTIS HC A03/MF A01

The relationships between recursive estimation schemes for single-input single-output systems are established by presenting a general diagram of which the least squares, generalized least squares, extended matrix, instrumental variable, approximated maximum likelihood, implicit quasilinearization, filtered instrumental variable estimation, (sub) optimal instrumental variable, and the instrumental variable variant of the extended matrix method estimators are special cases. In the diagram, three operations can be distinguished: noise filtering; model extension; and instrumental variable generation. It is shown that by proper combination of these three main operations, all the estimators mentioned can be constructed. ESA

PARALLEL SOLUTION OF LINEAR SYSTEMS WITH STRIPED SPARSE MATRICES. PART 1. VLSI NETWORKS FOR STRIPED MATRICES
Rami Melhem Jan. 1986 50 p
(Contract N00014-85-K-0339)
(AD-A166046; ICMA-86-91-Pt-1) Avail: NTIS HC A03/MF A01 CSCL 12/1

The multiplication of a matrix by a vector and the solution of triangular linear systems are the most demanding operations in the majority of iterative techniques for the solution of linear systems. Data-driven VLSI networks that perform these two operations efficiently for sparse matrices are introduced. In order to avoid computations that involve zero operands, the non-zero elements in a sparse matrix are organized in the form of non intersecting stripes, and only the elements within the stripe structure of the matrix are manipulated. Detailed analysis of the networks proves that both operations may be completed in n global cycles with minimal communication overhead, where n is the order of the linear system. The number of cells in each network as well as the communication overhead are determined by the stripe structure of the matrix. A companion paper examines this structure for the class of sparse matrices generated in Finite Element Analysis. Author (GRA)

PARALLEL SOLUTION OF LINEAR SYSTEMS WITH STRIPED SPARSE MATRICES. PART 2. STIFFNESS MATRICES, A CASE STUDY
Rami Melhem Jan. 1986 34 p
(Contract N00014-85-K-0339)
(AD-A166047; ICMA-86-92-Pt-2) Avail: NTIS HC A03/MF A01 CSCL 12/1

The stripe structures of stiffness matrices resulting from irregular domains covered by regular grids are analysed. It is proved that the non-zero elements in these matrices may be covered by very few stripes, and that these stripes may be non-overlapping, if the nodes of the grids are numbered appropriatly. The exact number of stripes, which is independent of the size of the problem, is derived for different types of grids and different numbering schemes. The stripe structure of some irregular grids are also examined. GRA

DEVELOPMENT AND APPLICATION OF THE P-VERSION OF THE FINITE ELEMENT METHOD Annual Report, 30 Sep. 1984 - 29 Sep. 1985
I. Norman Katz 21 Nov. 1985 35 p
(Grant AF-AFOSR-0315-82)
(AD-A166056; AFOSR-86-0087TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The p-version of the finite element method is a new, important, computationally efficient, approach to finite element analysis. It is more robust than the conventional h-version and its rate of convergence, for domains with corners and for other singularity problems, is twice that of the h-version. Hierarchic elements which implement the p-version efficiently have been formulated so as to enforce C(0) or C(1) continuity in the planar case, and so as to enforce C(0) continuity in three dimensions. ON USING MULTIPLE INVERTED TREES FOR PARALLEL UPDATING OF GRAPH PROPERTIES
Shaunak Pawagi and I. V. Ramakrishnan May 1985 28 p
(Contracts N00014-84-K-0530; F49620-83-C-0082; Grant NSF ECS-84-04399)
(AD-A166058; CAR-TR-124; CS-TR-1502; AFOSR-86-0045TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

Fast parallel algorithms are presented for updating the distance matrix, shortest paths for all pairs and biconnected components for an undirected graph and the topological ordering of vertices of a directed acyclic graph when an incremental change has been made to the graph. The kinds of changes that are considered here include insertion of a vertex of insertion and deletion of an edge or a change in the weight of an edge. The machine model used is a parallel random access machine which allows simultaneous reads but prohibits simultaneous writes into the same memory location. The algorithms described in this paper require O(log n) time and use 0(N-cubed) processors. These algorithms are efficient when compared to previously known 0(log-squared of n) time start-over algorithms for initial computation of the above mentioned properties of graphs. The previous solution is maintained in multiple inverted trees (a rooted tree where a child node points toward its parent) and after a minor change the new solution is rapidly recomputed from these trees. PERFORMANCE OF DISCRETE-TIME PREDICTORS OF CONTINUOUS-TIME STATIONARY PROCESSES Technical Report, Sep. 1985 - Aug. 1986
Stamatis Cambanis and Elias Masry Dec. 1985 52 p
(Contracts F49620-85-C-0144; N00014-84-K-0042)
(AD-A166231; TR-123; AFOSR-86-0013TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

This document studies the asymptotic performance of linear predictors of continuous-time stationary processes from observations at n sampling instants on a fixed observation interval. Considered are both optimal and simpler choices of predictor coefficients; uniform sampling, as well as nonuniform sampling tailored to the statistics of the process under prediction. The authors concentrate on stationary processes with rational spectral densities and obtain the asymptotic performance for cases with no and with one quadratic-mean derivative. The analytical results are supplemented by numerical examples depicting small and large sample size performance. Author (GRA)

BIASED AND UNBIASED CROSS-VALIDATION IN DENSITY ESTIMATION
David W. Scott and George R. Terrell Apr. 1986 52 p
(Contracts N00014-85-K-0100; DAAG29-85-K-0212; N00014-83-K-0472; Grant N00014-83-G-0121)
(AD-A166905; LCS-TR-23) Avail: NTIS HC A04/MF A01 CSCL 12/1

Nonparametric density estimation requires the specification of smoothing parameters. The demands of statistical objectivity make it highly desirable to base the choice on properties of the data set. This paper introduces some biased cross-validation criteria for selection of smoothing parameters for kernel and histogram density estimators. These criteria are obtained by estimating L sub 2-norms of derivatives of the unknown density and provide slightly biased estimates of the average squared-L sub 2 error or mean integrated squared error. These criteria are roughly the analog of the generalized cross-validation procedure for orthogonal series density estimators. The authors present the relationship of the biased cross-validation procedure to the least squares cross-validation procedure, which provides unbiased estimates of the mean integrated squared error. Both methods are shown to be based on U-statistics. The two methods are compared through theoretical calculation of the noise in the cross-validation functions and corresponding cross validated smoothing parameters, by Monte Carlo simulation, and by example. Surprisingly large gains in asymptotic efficiency are observed between biased and unbiased cross-validation when the underlying density is sufficiently smooth. Reliability of cross-validation for finite samples is discussed. GRA

OPTIMUM ACCELERATION FACTORS FOR ITERATIVE SOLUTIONS OF LINEAR AND NON-LINEAR SYSTEMS Final Report, 1 Dec. 1984 - 30 Nov. 1985
George S. Dulikravich and David M. Young, Jr. 30 Dec. 1985 47 p
(Grant AF-AFOSR-0052-85)
(AD-A167171; AFOSR-86-0221TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

Two different approaches to the acceleration of iterative algorithms for the numerical solution of differential systems have been developed. General form of the non-linear minimal residual method has been analytically determined and numerically confirmed for solving linear and non-linear problems. The method was applied to multi-step algorithms for effectively determining optimal values of each of the acceleration parameters at each time step. It was found that both the rate of iterative convergence and the smoothness of the iterative convergence can be substantially augmented by the use of these multiple optimal acceleration parameters. The second approach involves a composite adaptive method which is based on variational techniques. An automatic procedure for determining splitting parameters needed in the iterative solution of large sparse linear systems was developed. It was then complemented with the generalized conjugate gradient acceleration procedures and successfully applied in the symmetric successive overrelaxation method and in the shifted incomplete Cholesky method. GRA

UNIQUE SOLUTION TO A NONLINEAR ORDINARY DIFFERENTIAL EQUATION
Niall W. Kline (Boeing Computer Services Co., Richland, Wash.) Dec. 1985 13 p
(Contract DE-AC06-77RL-01030)
(DE86-005236; RHO-BW-SA-479-P) Avail: NTIS HC A02/MF A01

Numerous approaches have been employed in solving the equation governing unsteady conduction of heat along the radius of an annular cross section. One such method is described by Ozisik, in the spatial propagation of temperature is approximated by an elementary function of the penetration distance of a limiting quantity of heat. This method reduces the original problem, solving a partial differential equation for a function of two independent variables, to that of solving an ordinary differential equation for the approximate penetration distance as a function of time. Of interest here is the solution to the equation for penetration distance when, instead of heat conduction, the approximation method is applied to radial diffusion of decaying mass. DOE

PIECEWISE ANALYTICAL PERTURBATION SERIES METHODS FOR SOLVING LINEAR ORDINARY DIFFERENT EQUATION. PART 1: GENERAL SCHEMES FOR ALGORITHM IMPLEMENTATION
Gh. Adam Dec. 1984 44 p
(DE86-700605; IFIN-FT-256-1984-Pt-1) Avail: NTIS (US Sales Only) HC A03/MF A01

The piecewise analytical perturbation series (PAPS) approach to the solution of linear ordinary differential equations is shown to provide both PAPS algorithms and equations for the accumulated discretization errors, each of which involving the same set of propagators, a property which is very important for the implementation of PAPS codes with global control over the discretization error. Finite, simple and flexible PAPS algorithms can be derived provided the coefficients of the given differential equation are approximated by truncated piecewise Legendre series. Theoretical realization of such algorithms are outlined and their orders of accuracy are established. DOE

EFFECTS OF STIFFNESS
L. F. Shampine Mar. 1986 18 p
(Contract DE-AC04-76DP-00789)
(DE86-009559; SAND-86-0304) Avail: NTIS HC A02/MF A01

One-step methods for the numerical solution of the initial value problem for a system of ordinary differential equations are studied. The question addressed is, what happens when a code intended for non-stiff problems is applied to a stiff problem. DOE

N86-31294# Oak Ridge National Lab., Tenn.
PROPAGATORS FOR GENERAL NONLINEAR EQUATIONS
D. G. Cacuci, R. B. Perez, and V. Protopopescu May 1986 14 p
(Contract DE-AC05-84OR-21400)
(DE86-010071; ORNL/TM-10016) Avail: NTIS HC A02/MF A01

Propagators - advanced and retarded - are introduced for nonlinear problems and it is shown that they generalize the Green's functions used to solve linear problems. These propagators are generated by using the dual operator which plays, for the nonlinear problem, the same role as the customary adjoint operator for linear problems. The propagators obey a reciprocity relationship and satisfy a closed nonlinear integral equation or, alternatively, a linear integral equation that depends parametrically on the

problem's solution. These equations are formulated in a canonical way, independent of dimensionally, boundary conditions and type of the underlying nonlinear problem. DOE

THE ASYMPTOTIC EXPANSION OF THE GLOBAL ERROR OF THE BOX SCHEME IN A STIFF CASE
M. vanVeldhuizen Mar. 1984 28 p
(IR-251; ESA-86-97340) Avail: NTIS HC A03/MF A01
The existence of an asymptotic expansion of the global error for a stiff ordinary differential equation on a highly nonuniform mesh is considered. A stability estimate for the box scheme (scalar case only) almost without any restriction between the mesh and stiffness parameter is given. The possible extensions and the difficulties involved are also discussed. ESA

EXTRAPOLATED MIDPOINT RULE FOR DIFFERENTIAL EQUATIONS. PART 1: EXPANSION THEOREMS
Maarten deGee May 1984 39 p
(IR-255-Pt-1; ESA-86-97343) Avail: NTIS HC A03/MF A01
The approximation obtained by the explicit midpoint rule, initialized by one Euler step, of delay-differential equation is considered. The fact that there are functions ek such that the expansion of the global discretization error depending on ek exists even if the solution of delay-differential equation has jump discontinuities in its derivatives over certain points, is discussed. The fact the Richardson extrapolation to the limit is applied to improve the approximation is proved. Results show that the local extrapolation as in Gragg-Bulirsch-Stoer method for ordinary differential equations by consideration of a set of fixed step sizes can be used. ESA

DISCRETE APPROXIMATION OF EIGENFUNCTION EXPANSIONS OF SELF ADJOINT ORDINARY DIFFERENTIAL OPERATORS
G. Y. Nieuwland Jul. 1984 22 p Presented at Symposium dedicated to Professor A. van de Vooren, Groningen, Netherlands, 22 Jun. 1984
(IR-263; ESA-86-97347) Avail: NTIS HC A02/MF A01
The fact that the spectrum, spectral measures and the eigenfunctions for a self adjoint ordinary differential operator (ODO) can be approximated by numerically implementable algorithm is discussed. The fact that strong discrete approximation of a set adjoint ODO implies distributional convergence of spectral resolution is presented. ESA

N86-31305# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
THE BEST BOUND IN THE L LOG L INEQUALITY OF HARDY AND LITTLEWOOD AND ITS MARTINGALE COUNTERPART
David Gilat Sep. 1984 15 p Sponsored by Vrije Univ., Amsterdam, Netherlands
(IR-266; ESA-86-97348) Avail: NTIS HC A02/MF A01
The inequalities deduced from the maximal Hardy-Littlewood theorem and the Doob's theorem similar martingale are considered. The sharpness for the L log L (L times the logarithm of L) is studied. The best bound of L log L and its corresponding martingale description are presented. ESA

N86-31306# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
TRANSFINITE CLASSIFICATION OF WEAKLY-INFINITE DIMENSIONAL SPACES
Piet Borst Feb. 1985 35 p
(IR-276; ESA-86-97353) Avail: NTIS HC A03/MF A01

The fact that every weakly infinito-dimensional space X which does not have a weakly infinito-dimensional metric compactification can be an associate of two ordinal numbers called index X and weakly-ind X, is discussed. The fact that for every small infinito-dimensional space X the index is a function of the ordinal exponentiation, is proved. The number index X is a generalization of Pol's concept over weakly infinito-dimensional compact metric spaces. ESA

TESTING AND COMBINATION OF CONFIDENCE ELLIPSES: A GEOMETRIC ANALYSIS Final Report
Janet Myhre, Michael Rennie, and Will Duquette 5 Aug. 1985 54 p Prepared in cooperation with Mathematical Analysis Research Corp., Claremont, Calif.
(Contract NAS7-918)
(NASA-CR-176987; JPL-D-2782; NAS 1.26:176987; AD-A166581) Avail: NTIS HC A04/MF A01 CSCL 15/4

This document is one of a series of algorithm analysis reports performed for the US Army Intelligence Center and School covering selected algorithms in existing or planned Intelligence and Electronic Warfare (IEW) systems. This report proves several properties of the ellipse combination process as used in correlation algorithms, both alone and in combination with the associated statistical tests. In particular, it is shown that the statistical tests introduce order dependence to the combination process. A confidence ellipse, sometimes called an EEP, is one of the ways in which intelligence data concerning an emitter's location is summarized. Such an ellipse is always centered at the estimated emitter location and is a measure of the possible error in the location estimate. The goal of this paper is to examine the geometric implications and properties of the statistical test for deciding whether two estimates refer to the same emitter, and of the method of combination for confidence ellipses. ALL SUBSETS REGRESSION IN COX MODEL
Anthony Y. C. Kuk 4 Mar. 1986 16 p
(Contracts N00014-76-C-0475; NR Proj. 042-267)
(AD-A166897; TR-370) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper shows that within the framework of the proportional hazards model all subset regression can be performed with very little computational efforts. A selection criterion based on Wald statistic is motivated by a cross-validation argument in which the status of one observation is changed from uncensored to censored. This criterion is seen to be formally equivalent to Mallow's C sub P and thus the problem is reduced to one readily handled by standard statistical packages. The procedure is applied to the multiple myeloma data to give results remarkably different from those obtained by previous workers using stepwise procedures. New insights are gained and the superiority of all subset regression over stepwise regression is clearly demonstrated. GRA

BOOTSTRAPPING NONLINEAR LEAST SQUARES ESTIMATES IN THE KALMAN FILTER MODEL
David S. Stoffer Jan. 1986 27 p
(Contract F49620-85-C-0008; Grant AF-AFOSR-0113-84)
(AD-A167099; TR-86-02; AFOSR-86-0252TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The bootstrap is proposed as a method for estimating the precision of forecasts and maximum likelihood estimates of the transition parameters of the Kalman filter model when the estimates are obtained via Newton-Raphson. It is shown that when the system and the filter are in steady state, the bootstrap applied to the Gaussian innovations yields asymptotically consistant standard errors. That the boot strap works well with moderate sample sizes and supplies robustness against departures from normality is substantiated by emperical evidence. Author (GRA)

CENTRAL LIMIT THEOREM FOR VARIABLE SIZE SIMPLE RANDOM SAMPLING FROM A FINITE POPULATION
T. Wright Feb. 1986 27 p
(Contract DE-AC05-84OR-21400)
(DE86-007092; ORNL/TM-9864) Avail: NTIS HC A03/MF A01

This paper introduces a sampling plan for finite populations herein called variable size simple random sampling and compares properties of estimators based on it with results from the usual fixed size simple random sampling without replacement. Necessary and sufficient conditions (in the spirit of Hajek) for the limiting distribution of the sample total (or sample mean) to be normal are given. DOE

N86-31313# Oak Ridge National Lab., Tenn.
VARIANCE REDUCTION METHODS APPLIED TO DEEP-PENETRATION MONTE CARLO PROBLEMS
S. N. Cramer and J. S. Tang Jan. 1986 78 p
(Contract DE-AC05-84OR-21400)
(DE86-007080; ORNL/TM-9643) Avail: NTIS HC A05/MF A01

A review of standard variance reduction methods for deep-penetration Monte Carlo calculations is presented. Comparisons and contrasts are made with methods for nonpenetration and reactor core problems. Difficulties and limitations of the Monte

Carlo method for deep-penetration calculations are discussed in terms of transport theory, statistical uncertainty and computing technology. Each aspect of a Monte Carlo code calculation is detailed, including the natural and biased forms of (1) the source description, (2) the transport process, (3) the collision process, and (4) the estimation process. General aspects of cross-section data use and geometry specification are also discussed. Adjoint calculations are examined in the context of both complete calculations and approximate calculations for use as importance functions for forward calculations. The idea of importance and the realization of the importance function are coverd in both general and mathematical terms. Various methods of adjoint importance generation and its implementation are covered, including the simultaneous generation of both forward and adjoint fluxes in one calculation. A review of the current literature on mathematical aspects of variance reduction and statistical uncertainty is given. Three widely used Monte Carlo codes MCNP, MORSE, and TRIPOLI - are compared and contrasted in connection with many of the specific items discussed throughout the presentation. DOE

ASYMPTOTIC DISTRIBUTIONS IN PARAMETERIZED FUNCTIONAL RELATIONS [ASYMPTOTISCHE VERDELINGEN IN GEPARAMETRISEERDE FUNCTIONELE RELATIES]
H. N. Linssen and L. T. M. E. Hillegers Jul. 1984 27 p In DUTCH
(Memo-COSOR-84-09; ESA-86-97311) Avail: NTIS HC A03/MF A01

For a large class of functional relations the asymptotics of the estimators were derived using Wilks' theory of estimate equations. A special case of the theory, the normality of perceptual errors, was treated. The error covariance matrix was parameterized, which made the asymptotics complex, with an asymptotic dependance upon the structural parameter and error parameter estimators. Simple identification conditions are given. A calculus for the differentiation of multivariate statistical matrix functions was developed. ESA

TOWARDS AUTOMATIC MARKOV RELIABILITY MODELING OF COMPUTER ARCHITECTURES
Carlos A. Liceaga and Daniel P. Siewiorek (Carnegie-Mellon Univ., Pittsburgh, Pa.) Aug. 1986 67 p
(NASA-TM-89009; NAS 1.15:89009) Avail: NTIS HC A04/MF A01 CSCL 12B

The analysis and evaluation of reliability measures using time-varying Markov models is required for Processor-Memory-Switch (PMS) structures that have competing processes such as standby redundancy and repair, or renewal processes such as transient or intermittent faults. The task of generating these models is tedious and prone to human error due to the large number of states and transitions involved in any reasonable system. Therefore model formulation is a major analysis bottleneck, and model verification is a major validation problem. The general unfamiliarity of computer architects with Markov modeling techniques further increases the necessity of automating the model formulation. This paper presents an overview of the Automated Reliability Modeling (ARM) program, under development at NASA Langley Research Center. ARM will accept as input a description of the PMS interconnection graph, the behavior of the PMS components, the fault-tolerant strategies, and the operational requirements. The output of ARM will be the reliability of availability Markov model formulated for direct use by evaluation programs. The advantages of such an approach are (a) utility to a large class of users, not necessarily expert in reliability analysis, and (b) a lower probability of human error in the computation. Author

STUDIES IN MATHEMATICAL MODELS OF HUMAN DECISION-MAKING IN GAMING SITUATIONS Final Report, 1 Aug. 1984 - 31 Jan. 1986
David A. Castanon 6 Apr. 1986 155 p
(Contract N00014-84-C-0458)
(AD-A166698; TR-283) Avail: NTIS HC A08/MF A01 CSCL 05/10

This document studies two classes of mathematical models of dynamics multiperson decisionmaking which focus on the subjective nature of human decisionmaking. It develops extensions to game theory models which allow for differences in subjective perceptions of the decision problem among decisionmakers. Studies are the effects of these extensions on qualitative results available for two multiperson decisionmaking paradigms, one cooperative and one noncooperative, and characterize new classes of outcomes which become rational under our theory. The results provide a foundation for the development of a quantitative predictive theory of multiperson decisionmaking which incorporates the subjective properties of human decisionmaking behavior. DETERMINISTIC SENSITIVITY THEORY FOR NONLINEAR SYSTEMS: THE FORWARD AND THE ADJOINT METHOD
D. G. Cacuci 1986 80 p Presented at the ISPRA Course on Data Uncertainties, Sensitivities, Consistency and Adjustment, Ispra, Italy, 14 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009512; CONF-8604168-1) Avail: NTIS HC A05/MF A01

The main aspects underlying the rigorous mathematical formulation of deterministic sensitivity theory for nonlinear systems are presented; this formulation is based on the work by Cacuci and employs concepts and methods of nonlinear functional analysis. The functional analytic concepts underlying sensitivity theory are briefly reviewed in Section 2. The rigorous formulation of sensitivity theory for nonlinear systems is presented in Section 3. Section 3. A presents the sensitivity theory for nonlinear

systems with operator-type responses. Section III.B presents the development of the sensitivity theory for nonlinear systems with responses defined at critical points of a function of the system's state vector and parameters (maxima, minima, and saddle points). Section III.C presents sensitivity theory for nonlinear systems with feedback. Finally, Section IV summarizes and highlights the main points underlying deterministic sensitivity theory for nonlinear systems and discusses the potential of using functional analytic concepts to extend further the scope of this theory. SIEVES FOR GAUSSIAN PROCESSES Annual Report, 30 Sep. 1984 - 29 Sep. 1985
Jay H. Beder 27 Nov. 1985 6 p
(Grant AF-AFOSR-0329-84)
(AD-A166055; AFOSR-86-0069TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Several important properties of a proposed sieve estimator for the mean of a Gaussian process of known covariance have been established. The estimator is itself a Gaussian process; under a separability assumption, it is asymptotically unbiased and weakly consistent at each time t, and is strongly consistent (globally) in an appropriate norm. For a Gaussian process with zero mean and unknown covariance, it is shown that the likelihood for the covariance is in general unbounded almost surely. Moreover, properties of a proposed sieve estimator have been developed for the covariance analogous to those for the mean. No assumption is made about the nature of the time parameter t, either for the mean estimator or for the covariance estimator. Author (GRA)

SEQUENTIAL AND PARALLEL MATRIX COMPUTATIONS Interim Report, 1 Sep. 1984 - 31 Aug. 1985
Biswa N. Datta Nov. 1985 6 p
(Grant AF-AFOSR-0334-83)
(AD-A166062; AFOSR-86-0067TR) Avail: NTIS HC A02/MF A01 CSCL 09/2

The major objectives of this project are to develop computational algorithms, both sequential and parallel, for several important linear algebra problems that arise in the design and analysis of linear control systems governed by the systems of ordinary differential equations. These include controllability problems, stability and inertia problems, pole assignment problems, matrix equations problems, relative primeness of polynomials and matrices and the cauchy-index problems of rational functions etc. Besides, a part of the project is devoted to the theoretical study of the parallel arithmetic complexity of these problems; that is, how fast these problems can be solved in parallel assuming that sufficiently many processors are available. Though some numerically viable sequential algorithms have been designed for some of these problems in recent years, parallel algorithms and algorithms for large scale problems are virtually non-existent. GRA

VARIATIONAL COUPLING BETWEEN Q-NUMBER AND C-NUMBER DYNAMICS [ACOPLAMENTO VARIACIONAL ENTRE DINAMICAS Q-NUMBER E DINAMICAS C-NUMBER]
C. M. do Amaral and S. Joffily 1984 18 p In PORTUGUESE
(DE86-700604; CBPF-NF-066/84) Avail: NTIS (US Sales Only) HC A02/MF A01

The time-dependent quantum variational principle is generalized for the case of Hamiltonian operators having real parameters and their time derivates. The obtained variational system is formed by a Schroedinger equation coupled to a Lagrange equation system. Where the lagrangian is the average value of the parametrized Hamiltonian operator. The consequent dynamics of the variational principle describes the interaction between a q-number sub-dynamics with a c-number sub-dynamics. In the (h/2(PI))(0)-order W.K.B. approximation, the variational system reduces to a Hamilton-Jacobi-like equation, coupled to a lagrange equation family. The formal features of the obtained variational system are appropriated for the description of, adiabatics and non-adiabatics, time-dependent q-number c-number interactions. DOE

A METHOD FOR CONSTRUCTING ORDERED CONTINUA
Klaas Pieter Hart and Jan vanMill Mar. 1984 25 p
(IR-240; ESA-86-97330) Avail: NTIS HC A02/MF A01

Compact, connected linear ordered topological spaces (ordered continuums) are considered. A general method for constructing ordered continua from families of subjets of the real interval of extremities 0 and 1 is given. An example of a continuum with the property that every uncountable subset contains an uncountable subset isomorphic to the subset of the real numbers system is given. ESA

N86-31325# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
THE HOPF ALGEBRA OF SYMMETRIC FUNCTIONS [DE HOPFALGEBRA VAN DE SYMMETRISCHE FUNCTIES]
E. J. Ditters May 1984 98 p In DUTCH
(IR-250; ISBN-90-71058-01-8; ESA-86-97339) Avail: NTIS HC A05/MF A01

The isomorphism theta between the Hopf algebra of symmetric funtions in the complex plane (C) and theta R(Sn) for n=0... infinite (R(Sn) is the ring of virtual complex representations of the symmetric group Sn) was studied to find the in-product on the last ring in C. Using Liulevicus, proofs applicable to other basic rings than just in the real plane are derived. Two canonical bilinear forms in C, one positively definite corresponding with the classical in-product, and the other indefinite, were constructed. Without using representations, the existence of an orthonormal base (Schur-functions) is found. Using Dieudonne, S-adic symmetric functions are defined. An S-adic Newton rule and a duality proposition for

the S-adic symmetric functions algebra are found. A representation of Grothendiecks lambda-ring is given, using Hilbert operators from the theory of commutative formal groups, valuable for rings without additive torsion, and satisfying mild mathematical conditions. ESA

N86-31326# Vrije Universiteit, Amsterdam (Netherlands). Dept. of Mathematics and Computer Science.
A SEPARABLE NORMAL TOPOLOGICAL GROUP WHICH IS NOT LINDELOEF
Klaas Pieter Hart and J. vanMill May 1984 17 p
(IR-252; ESA-86-97341) Avail: NTIS HC A02/MF A01
An example of a separable normal group which contains a closed subspace homeomorphic to an incountable regular cardinal, in Zermelo-Frankel Choice axiom (ZFC) is given. This is a negative answer to the question when a separable normal topological space is not Lindelof. A separable hereditary normal topological group without nice covering properties in ZFC is not shown. ESA

A STUDY OF METHODS TO PREDICT AND MEASURE THE TRANSMISSION OF SOUND THROUGH THE WALLS OF LIGHT AIRCRAFT Semiannual Status Report, 1 Oct. 1985 - 15 May 1986
R. J. Bernhard, J. S. Bolton, B. Gardner, J. Mickol, C. Mollo, and C. Bruer May 1986 35 p
(Grant NAG1-58)
(NASA-CR-177147; NAS 1.26:177147; PRF-520-1288-0353; Rept-0353-3; HL86-19) Avail: NTIS HC A03/MF A01 CSCL 20A
Progress was made in the following areas: development of a numerical/empirical noise source identification procedure using bondary element techniques; identification of structure-borne noise paths using structural intensity and finite element methods;

development of a design optimization numerical procedure to be used to study active noise control in three-dimensional geometries; measurement of dynamic properties of acoustical foams and incorporation of these properties in models governing three-dimensional wave propagation in foams; and structure-borne sound path identification by use of the Wigner distribution. VIBRATION AND STRUCTUREBORNE NOISE IN SPACE STATION Progress Report, 1 Jan. - 30 Jun. 1986
Rimas Vaicaitis 1986 23 p
(Grant NAG1-541)
(NASA-CR-177146; NAS 1.26:177146) Avail: NTIS HC A02/MF A01 CSCL 20A

Analytical models and computer programs for structural response calculations under action of mechanical point loads were developed for single wall shells (composite or aluminum), double wall shells (composite or aluminum), and single wall or double wall circular plates (aluminum). The design configuration of the habitability modules of the space station concept are expected to be discretely stiffened cylindrical shells with truncated cone type end caps or flat but stiffened circular end plates. Analytical formulations and response calculations were performed for the case where the stiffened shell is represented by an orthotropic shell model. The natural frequencies can be calculated. For application to low frequency (below 1000Hz) vibrations and noise generation, such a model might be adequate to evaluate vibration and noise transmission characteristics of space station habitability modules. Parametric studies are now being performed to assess interior noise environment inside a habitability module to mechanically induced vibrations. B.G.

ACOUSTIC TREATMENT OF THE NASA LANGLEY 4- BY 7-METER TUNNEL: A FEASIBILITY STUDY
James C. Yu and A. Louis Abrahamson (Comtek, Grafton, Va.) Aug. 1986 38 p
(NASA-TP-2563; L-16037; NAS 1.60:2563) Avail: NTIS HC A03/MF A01 CSCL 20A

A feasibility study for upgrading the NASA Langley 4- by 7-Meter Tunnel so that it may be used for aeroacoustic research related to helicopters is described. The requirements for noise research leading to the design of the next generation of helicopters impose a set of acoustic test criteria that no existing wind tunnel in the United States can presently meet. Included in this feasibility study are the following considerations: (1) an evaluation of general wind-tunnel requirements and desired tunnel background noise levels for helicopter aeroacoustic research; (2) an assessment of the present acoustic environment for testing model rotors; (3) a diagnostic investigation of tunnel background noise sources and paths; (4) acoustic treatment options for tunnel background noise reduction and a trade-off study between these options; (5) an engineering feasibility assessment of the selected option; and (6) an integrated analysis of study components and recommendations of treatment for an approach to meet the tunnel background noise reduction goal. It is concluded that the Langley 4- by 7-Meter Tunnel is a fundamentally suitable facility for helicopter aeroacoustic research. It is also concluded that acoustic treatment of this facility for meeting the required tunnel background noise goal can be accomplished technically at reasonable risk and cost. M.G.

ADVANCED TURBOPROP NOISE PREDICTION: DEVELOPMENT OF A CODE AT NASA LANGLEY BASED ON RECENT THEORETICAL RESULTS
F. Farassat, M. H. Dunn (PRC Kentron, Inc., Hampton, Va.), and S. L. Padula Jul. 1986 58 p Presented at the 9th AIAA Aeroacoustics Conference, Williamsburg, Va., Oct. 1984
(NASA-TM-88993; NAS 1.15:88993; AIAA-84-2303) Avail: NTIS HC A04/MF A01 CSCL 20A

The development of a high speed propeller noise prediction code at Langley Research Center is described. The code utilizes two recent acoustic formulations in the time domain for subsonic and supersonic sources. The structure and capabilities of the code are discussed. Grid size study for accuracy and speed of execution on a computer is also presented. The code is tested against an earlier Langley code. Considerable increase in accuracy and speed of execution are observed. Some examples of noise prediction of a high speed propeller for which acoustic test data are available are given. A brisk derivation of formulations used is given in an appendix. Author

STRUCTUREBORNE NOISE IN AIRCRAFT: MODAL TESTS
Sherman A. Clevenson and Vern L. Metcalf Jul. 1986 36 p
(DA Proj. 1L1-61102-AH-45)
(NASA-TM-87739; NAS 1.15:87739; USAAVSCOM-TM-86-B-3) Avail: NTIS HC A03/MF A01 CSCL 20A

As part of an investigation to develop measurement techniques for structureborne noise, three modal surveys have been conducted on an OV-10A aircraft and the results have been presented. The purpose of the modal surveys was to identify suitable locations for mounting accelerometer and strain gages in subsequent tests in which transfer functions relating wing vibration to interior noise were to be determined. These surveys are as follows:(1) wing/fuselage modal survey utilizing one shaker under the right wing; (2) complete wing modal survey utilizing two shakers, one under each wing; and (3) fuselage side panel modal survey utilizing a small instrumented hammer. The predominant frequencies and damping ratios for each analysis were listed in tables. The primary mode shapes at the lower frequencies and at frequencies near the expected engine driving frequencies have been shown for each survey. Author

DIRECTIVITY AND TRENDS OF NOISE GENERATED BY A PROPELLER IN A WAKE
P. J. W. Block and Carl L. Gentry, Jr. Sep. 1986 63 p
(NASA-TP-2609; L-16131; NAS 1.60:2609) Avail: NTIS HC A04/MF A01 CSCL 20A

An experimental study of the effects on far-field propeller noise of a pylon wake interaction was conducted with a scale model of a single-rotation propeller in a low-speed anechoic wind tunnel. A detailed mapping of the noise directivity was obtained at 10 test conditions covering a wide range of propeller power landings at several subsonic tip speeds. Two types of noise penalties were investigated-pulser and spacing. The pusher noise penalty is the difference in the average overall sound pressure level, OASPL, for pusher and tractor installations. (In a pusher installation, the propeller disk is downstream of a pylon or another aerodynamic surface.) The spacing noise penalty is the difference in the average OASPL for different distances between the pylon trailing edge and the propeller. The variations of these noise penalties with axial, or flyover, angle theta and circumferential angle phi are presented, and the trends in these noise penalties with tip Mach number and power loading are given for selected values of theta

and phi. The circumferential directivity of the noise from a pusher installation showed that the addition noise due to the interaction of the pylon wake with the propeller had a broad peak over a wide range of circumferential angles approximately perpendicular to the pylon with a sharp minimum 90 deg. to the pylon for the majority of cases tested. The variation of the pusher noise penalty with theta had a minimum occurring near the propeller plane and maximum values of as much as 20 dB occurring toward the propeller axes. The magnitude of the pusher noise penalty generally decreased as propeller tip Mach number or power loading was increased. Author

TRACK PARAMETER EXTRACTION USING MULTIPATH DELAY AND DOPPLER INFORMATION Final Report
Khosrow Lashkari, Benjamin Friedlander, and Jonathan Abel Feb. 1986 195 p
(Contract N00014-84-C-0408)
(AD-A166044; Rept-5517) Avail: NTIS HC A09/MF A01 CSCL 17/1

The goal of the multipath project is to develop techniques to make use of the multipath reflections of acoustic signals travelling in the ocean to localize and track radiating sources. There have been two main areas of study under this contract. The first area concentrates on the detection and estimation of the multipath (or differential) delays in the received signals; the second is the development of localization and tracking algorithms. Previous work on the multipath project included the development of differential delay estimation algorithms as well as theoretical studies resulting in bounds on the variance of estimating multipath delay. Bounds were also placed on the accuracy of estimating various so-called track parameters -speed, depth, and range at closest approach of the target to the sensor array. Under the present contract, software was developed to estimate multipath delay using real or simulated data as input. Also under the present contract, tracking algorithms were developed. GRA

PROBLEMS IN NONLINEAR ACOUSTICS: PARAMETRIC RECEIVING ARRAYS, FOCUSED FINITE AMPLITUDE SOUND AND DISPERSIVE NONLINEAR INTERACTIONS Annual Summary Report, 1 Sep. 1985 - 30 Apr. 1986
Mark F. Hamilton 30 Apr. 1986 23 p
(Contract N00014-85-K-0708)
(AD-A167311; ASR-1) Avail: NTIS HC A02/MF A01 CSCL 20/1

Contract N00014-85-K-0708 provides for basic research on nonlinear acoustics. The three projects currently supported by the contract are as follows: 1) Use of a Parametric Receiving Array to Measure Ship Noise; 2) Focused Finite Amplitude Sound; and 3) Dispersive Nonlinear Wave Interactions in a Duct. The first project is the primary research effort supported by the contract, and the investigation is predominantly theoretical. The second involves computational analysis, the third experimental. Each project is discussed separately in the following sections. GRA

DUCTLESS ACOUSTICAL NOISE ATTENUATOR Patent Application
Robert H. Eustace, inventor (to Air Force) Filed 12 Mar. 1986 14 p
(AD-D012288; US-Patent-Appl-SN-838850) Avail: NTIS HC A02/MF A01 CSCL 13/1

A ductless noise attenuator is disclosed which includes a supply fitting mounted between an air conditioning unit and a recipient. The supply fitting blocks line-of-sight soundwaves using triangular-shaped protrusions on the inlet and outlet edges of a housing, and diamond-shaped core which fits in the housing and has edges which extend to the space between the triangular-shaped edges of the inlet and outlet of the housing. The diamond-shaped core is composed of: two leading edges, which form a wedge with its point facing the housing inlet; and two trailing edges which is overlapped by the triangular protrusions of the housing. Finally, a return fitting conducts air back to the air conditioning unit while blocking line-of-sight soundwaves with a diagonal divider within a return housing. The design of the attenuator is intended to provide a mininum construction on the airflow from the air conditioning unit, with a maximum of sound attenuation at audible frequencies by blocking line-of-sight soundwaves. SURFACE ACOUSTIC WAVE DUST-DEPOSITION SENSOR
G. E. Fasching and N. S. Smith Feb. 1986 16 p
(DE86-001068; DOE/METC-86-4059) Avail: NTIS HC A02/MF A01

Surface acoustic waves travel by interaction between the atoms near the surface of a solid, with the consequence that attenuation of these waves can be sensitive to dust accumulation on the surface across which they propagate. This report reviews the relevant acoustic theory and its application to the design of a system for evaluating the feasibility of using the attenuation of surface acoustic waves for monitoring surface dust-deposition rates. The monitoring system is described, and the results of preliminary experiments are given. The results indicate that multireflected surface acoustic waves are attenuated sufficiently by a specified, maximum dust-layer surface density of 3.10 x 10(5) mg/m(2) (200 mg/in(2)) and that this approach should be investigated further for application in high-temperature, corrosive-atmosphere, coal-conversion process applications. DOE

TIME-OF-FLIGHT SPECTROSCOPY OF IONIC AND METASTABLE FRAGMENTS FROM DISSOCIATING MOLECULES Final Technical Report, 15 Jun. 1980 - 14 Jun. 1985
Willis E. Lamb, Jr. and L. C. McIntyre, Jr. 14 Oct. 1985 40 p
(Grant AF-AFOSR-0218-80)
(AD-A166063; AFOSR-86-0071TR) Avail: NTIS HC A03/MF A01 CSCL 07/4

This research involved the dissociation of hydrogen-containing molecules by electron impact and the subsequent measurement of the velocity of proton or metastable hydrogen fragments using time-of-flight methods. The proton velocity distribution resulting from dissociation of the hydrogen halides resulted in information on excited states of the corresponding molecular ions with inner-shell electron holes. Another completed project involved the proton velocity distribution from electron bombardment of the triatomic molecules, water and hydrogen sulfide. A final experiment involved the detection, in coincidence, of proton and metastable hydrogen fragments from electron bombardment of hydrogen molecules. GRA

DEVELOPMENT OF LOW-ENERGY X-RAY SPECTROGRAPH SYSTEM Final Technical Report, 1 Jun. 1983 - 31 May 1984
Burton L. Henke Dec. 1985 10 p
(Grant AF-AFOSR-0222-83)
(AD-A166195; AFOSR-86-0052TR) Avail: NTIS HC A02/MF A01 CSCL 20/8

The technical report describes the design and construction of a state of the art, large aperture focussing spectrograph of the Johann/Johannson geometry, specially developed for the low energy x ray region of 50-5000 eV. The spectrographic system includes (1) a four kilowatt, demountable low voltage x ray excitation source, (2) a three-position holder for samples which are closely coupled to the excitation source and with a variable take-off angle, (3) a stepping motor driven scanner which accomodates large aperture curved crystal analyzers, a 10 in. diameter focussing circle, and an automatically adjusted exit slit that provides a constant solid angle of measured radiation from the same sample area

and at the same time take off angle for all Bragg angles, (4) tunable gas flow, sub-atmospheric pressure counter, and finally (5) provisions for a rapid and easy interchange of thin window filter mounts for both the x ray source and for the counter. A small computer has been specially interfaced to provide scan control, data acquisition and presentation, and preliminary data analysis. It is connected to a large computer for programmed resolution enhancement, de-convolution and the determination of absolute radiative yields from the experimental, overlapping atomic or molecular orbital spectral components. STUDIES OF HIGHLY EXCITED ATOMS Final Report
Ravinder Kachru 2 Apr. 1986 72 p
(Contract N00014-79-C-0202)
(AD-A166838; AD-E950814) Avail: NTIS HC A04/MF A01 CSCL 17/5

Rydberg states of atoms have intrinsic properties that should allow their use as highly sensitive and tunable detectors at far infrared wavelengths. The intrinsic limit of such atomic detectors are collisional processes. This report describes the results of a research program to better understand an important class of collisions--namely, the resonant collision of two Rydberg atoms. We have extensively measured the linewidths and the collision cross sections and have determined their dependence on parameters such as the principal quantum number and the Rydberg state angular momentum. The resonant collisions are shown to occur for a wide variety of initial states with cross sections of the order of 10 to the 9th power square-Angstroms and scaling as (n*O to the 4th order). GRA

[ACTIVITIES OF THE WERNER-HEISENBERG INSTITUTE OF PHYSICS] Annual Report, 1985
Jan. 1986 173 p In GERMAN
(ISSN-0173-6256; ESA-86-97430) Avail: NTIS HC A08/MF A01

The Experimental Division A performed experiments at CERN, on the Teratron accelerator of the Fermilab and on the electron-positron storage ring PETRA using the CELLO-detector; experiments on the electron-proton storage ring HERA and preliminary investigations of a possible double-beta-decay experiment were conducted; electronic devices, and data processing and evaluation systems were developed. The Experimental Division B made investigations of charm particles in hadronic interaction, and phenomenological studies; the ALEPH project is prepared for the electron-position storage ring LEP; silicon detectors, integrated electronics, and calorimeters were developed. The organization of the technical division and its tasks for current and planned experiments are described. The research work of the theoretical division (renormalization, grid calibration, elementary particles, standard model, cosmology, neutrino detector, quantum mechanics, nonlinear multiparticle physics) is summarized. INDUCED HIGGS COUPLINGS TO NEUTRAL BOSONS IN E+E- COLLISIONS
L. Bergstroem and G. Hulth Feb. 1985 30 p Sponsored by Swedish Natural Science Research Council
(USIP-85-08; ESA-86-97228) Avail: NTIS HC A03/MF A01

Induced couplings of the type HVgamma in the standard model, where H is a Higgs meson and V is a virtual or real neutral gauge boson are calculated. Applications for e+e- collisions and Higgs meson decays are given. The calculated rates are too low to make these processes an attractive way to search for the Higgs boson. However, once it is found, it is argued that these processes should be studied experimentally since the induced couplings probe the structure of the gauge theory in an interesting way. It may be possible to infer the existence of one or more heavy fermion generations by observing their virtual effects in radiative decays into Higgs particles. The related coupling HVgamma with V a heavy quarkonium vector state is mentioned. ESA

IDENTIFICATION OF NEUTRAL HIGGS BOSONS IN THE DELPHI DETECTOR AT LEP
P. O. Hulth and K. Hultquist Mar. 1985 26 p
(USIP-85-09; ESA-86-97229) Avail: NTIS HC A03/MF A01

A Monte Carlo study was performed to investigate the possibilites of observing and identifying a neutral Higgs boson H(0) in the DELPHI detector using the reaction e+e- yields Z(0) yields l(+) l(-) where l(+) and l(-) are leptons. Methods for identifying the H by its decay characteristics as predicted by the Lund Monte Carlo were considered. The most promising methods for identifying the H through its decay are the sphericity of the decay products in the H rest system and the number of leptons in the H decay. These methods require an integrated luminosity in the region 20 to 300 p/b, depending on the H mass, for a 3 sigma separation between H decay and the decay of a particle with equal couplings to all quarks. ESA

FEYNMAN DIAGRAMS AS FUNCTIONS OF QUARK MASS MATRICES, CP-VIOLATION, ELECTRIC DIPOLE MOMENTS AND THETA-PARAMETER OF QCD
C. Jarlskog Nov. 1985 17 p Sponsored by Swedish Natural Science Research Council
(USIP-85-22; ESA-86-97230) Avail: NTIS HC A02/MF A01

Feynman diagrams of the Standard Electroweak Model are written as functions of the quark mass matrices, and their CP properties are emphasized. The formalism is applied to the problem of the electric dipole moment of the quark. The connection between the determinant of the commutator of mass matrices and the renormalization of the theta-parameter of QCD is discussed. ESA

N86-31354# Stockholm Univ. (Sweden). Inst. of Physics.
THE F MESON
K. E. Johansson Jan. 1986 31 p
(USIP-86-01; ESA-86-97231) Avail: NTIS HC A03/MF A01

The experimental status of the F meson is reviewed. As its measurements are exceptionally difficult, mainly because of the complex ambiguity problems and the small F cross section, the results are not always very significant, and can be contradictory. Measurement of the F mass results in very different values, varying from 2040 to (1971 +or- 5) MeV/sqcm. The lifetime is not very precisely determined, but is estimated at (1 to 4) x 10 to the minus 13th power sec. ESA

NUMERICAL PREDICTIONS OF RAILGUN PERFORMANCE

INCLUDING THE EFFECTS OF ABLATION AND ARC DRAG
N. M. Schnurr, J. F. Kerrisk, and J. V. Parker 1986 7 p Presented at the 3rd Symposium on Electromagnetic Launch Technology, Austin, Tex., 20-24 Apr. 1986
(Contract W-7405-eng-36)
(DE86-008718; LA-UR-86-861; CONF-8604147-1) Avail: NTIS HC A02/MF A01

Thermal radiation from plasma armatures in railguns may cause vaporization and partial ionization of the rail and insulator materials. This causes an increase in mass of the arc, which has an adverse effect on projectile velocity. Viscous drag on the arc also has a deleterious effect, particularly at high velocities. These loss mechanisms are modeled in the Los Alamos Railgun Estimator code. Simulations were performed and numerical results were compared with experimental data for a wide range of tests performed at the Los Alamos and Lawrence Livermore National Laboratories, the Ling Temco Vought Aerospace and Defense Company, and the Center for Electromechanics at the University of Texas at Austin. The effects of ablation and arc drag on railgun performance are discussed. Parametric studies illustrate the effects of some design parameters on projectile velocity and launcher efficiency. Some strategies for reducing the effects of ablation are proposed. DOE

EXPERIMENTAL AND THEORETICAL HIGH ENERGY PHYSICS Progress Report, 1 Jan. 1985 - 31 Dec. 1985
1986 30 p
(Contract DE-AC02-83ER-40105)
(DE86-009052; DOE/ER-40105/512) Avail: NTIS HC A03/MF A01

Progress is reported in these theoretical areas: duality in quantum chromodynamics; KNO scaling and violations at high energies; covariant confinement equation with screening; cosmic ray antiprotons produced by a heavy galactic halo of stable photinos; W boson pair production in supersymmetry; hadronic interactions at very high energies; field theory in curved space; string theory; high-temperature transition from weak to strong coupling in QCD and in grand unified models; and strong coupling phase transitions in supersymmetric grand unified models. Experimental high energy physics activities include: testing of grand unified and supersymmetric models of the fundamental interactions through a search for proton decay and other rare phenomena; study of quantum chromodynamics in high energy, large angle hadronic interactions; study of weak interactions with emphasis on CP violation in neutral kaon decay; and a search for fractionally charged particles. The foremost accomplishment is reported to be the apparent discovery of underground, high-energy radiation related to the X-ray binary Cygnus X-3. DOE

AERODYNAMICS OF SEEING ON LARGE TRANSPORT AIRCRAFT Progress Report, 1 Dec. 1985 - 31 May 1986
William C. Rose 31 May 1986 102 p
(Contract NCC2-382)
(NASA-CR-177035; NAS 1.26:177033) Avail: NTIS HC A06/MF A01 CSCL 20F

Data were obtained in the full scale flight environment of the Kuiper Airborne Observatory (KAO) on the nature of turbulent shear layer over the open cavity. These data were used to verify proposed aerodynamic scaling relationships to describe the behavior of the turbulent layers and to estimate the optical performance of systems of various wavelengths operating within the KAO environment. These data and wind tunnel data are used to scale the expected optical effects for a potential stratospheric observatory for infrared astronomy (SOFIA) in which a telescope approximately 3.5 times larger than that on the KAO is envisioned. It appears that the use of combinations of active and passive aeromechanical flow control techniques can improve the optical behavior of systems in the SOFIA environment. Experiments to verify these potential improvements can be performed on the KAO with sufficient modifications to the cavity and aero-mechanical technique installations. Author

TECHNIQUES FOR OPTICAL INTERFERANEMOGRAPHY Final Report, 15 Sep. 1983 - 16 Jun. 1985
A. J. Lightman and S. Cartwright Dec. 1985 120 p
(Contract F33615-83-C-3020)
(AD-A165950; UDR-TR-85-101; AFWAL-TR-85-3098) Avail: NTIS HC A06/MF A01 CSCL 20/6

The suitability of available anemometry and interferometry systems for forming an optical interfranemography system has been evaluated. It was determined that a three-dimensional laser Doppler interferometer (LDA) should be able to provide the spatial and velocity resolution required. All standard interferometric systems measure the integrated index variation along the line of sight. Consequently, they do not provide spatial resolution and are only adequate in systems that are symmetric along the line of sight. If spatial resolution is required, a tomographic system can be used but the optical access required exceeds that commonly available in wind tunnels. To overcome these shortcomings a new interferometric technique was searched for. It was found that the Lau interferometer could be modified so that measurements were made in a restricted volume. The interferometer that was assembled and tested operated in a shearing mode. The system used a white light source, yielding a bright image, and the system is able to withstand severe vibrations without degrading the signal. The Lau interfereometer has been examined in detail and the theory of operation is presented. GRA

MULTIAPERTURE OPTICS Final Report, 15 Sep. 1984 - 14 Jan. 1986
Richard T. Schneider 1 Mar. 1986 81 p
(Grant AF-AFOSR-0304-84)
(AD-A167060; AFOSR-86-0233TR) Avail: NTIS HC A05/MF A01 CSCL 20/6

The basic principles of Multiaperture Optics are discussed. Based on the results generated under this program, certain applications for multiaperture optics were identified. The main features of an optical instrument based on the multiaperature principle are, that such a sensor will necessarily have to be small, and need to be a mass product. Large scale integration would have to be used to evaluate data collected and perform pattern recognition. It is a necessity to perform these functions in the sensor itself, using parallel input into the circuitry and experimental device has been built and tested. It is capable of recognizing simple shapes. The development of optical instruments, at least the photographic camera, was undoubtedly inspired by the then existing knowledge of the anatomy of the human eye. Therefore it is probably appropriate to try this approach again for the development of a new type of optical instrument based on the design of the insect eye. A brief description is given of the anatomy of the insect eye and an instrument is designed using similar components. GRA

SPACE-VARIANT OPTICAL SYSTEMS Annual Report, 30 Sep. 1984 - 30 Nov. 1985
John F. Walkup and Thomas F. Krile Jan. 1986 19 p
(Grant AF-AFOSR-0382-84)
(AD-A167275; AFOSR-86-0232TR) Avail: NTIS HC A02/MF A01 CSCL 20/6

Both analytical and experimental investigations of 1-D and 2-D coherent and incoherent space-variant optical processors have been conducted. The investigations included: (1) investigation of an improved measure of the degree of invariance of a linear system and its applications to piecewise isoplanatic space-variant systems; (2) a process for generalized linear filtering of 1-D signals; (3) investigation of a very fast architecture for performing optical multiplication of binary numbers and (4) techniques for both linear and nonlinear space-variant processing based on the bilinear transform. EFFECTS OF SURFACE MICROROUGHNESS IN ELLIPSOMETRY
E. L. Church and J. M. Zavada Dec. 1985 30 p Presented at the Workshop on Optical Fabrication and Testing, Tucson, Ariz., 18-22 Oct. 1976 Submitted for publication
(Contract DE-AC02-76CH-00016)
(DE86-008014; BNL-37051; CONF-761041-3; CONF-750993-4) Avail: NTIS HC A03/MF A01

We calculate the effects of surface roughness on the ellipsometric angles using plans-wave Rayleigh-Rice vector scattering theory. In the perturbation limit, these effects can be written in terms of weighted intergals over the power spectral density of the surface roughness. We present results in this limit for surfaces with arbitrary optical index and arbitrary two-dimensional roughness distributions, and then illustrate and assess them by considering four distinct limits: (1) deterministic roughness in the form of periodic corrugations; (2) statistical roughness with large transverse correlation lengths relative to the incident wavelength; (3) statistical roughness with small transverse correlation lenghts; and (4) highly reflecting surface materials. GLOBAL COORDINATES AND EXACT ABERRATION CALCULATIONS APPLIED TO PHYSICAL OPTICS MODELING OF COMPLEX OPTICAL SYSTEMS
G. Lawrence, C. Barnard, and V. K. Viswanathan 1986 8 p Presented at the SPIE Technical Symposium on Applications of Artificial Intelligence, Orlando, Fla., 31 Mar. - 4 Apr. 1986
(Contract W-7405-eng-36)
(DE86-008751; LA-UR-86-1027; CONF-860366-3) Avail: NTIS HC A02/MF A01

Historically, wave optics computer codes have been paraxial in nature. Folded systems could be modeled by unfolding the optical system. Calculation of optical aberrations is, in general, left for the analyst to do with off-line codes. While such paraxial codes were adequate for the simpler systems being studied 10 years ago, current problems such as phased arrays, ring resonators, coupled resonators, and grazing incidents optics require a major advance in analytical capability. This paper describes extension of the physical optics codes GLAD and GLAD V to include a global coordinate system and exact ray aberration calculations. The global coordinate system allows components to be positioned and rotated arbitrarily. Exact aberrations are calculated for components in aligned or misaligned configurations by using ray tracing to compute optical path differences and diffraction propagation. Optical path lengths between components and beam rotations in complex mirror systems are calculated accurately so that coherent interactions in phased arrays and coupled devices may be treated correctly. DOE

PROGRESS IN THE DESIGN OF OPTICAL FIBER SENSORS FOR THE MEASUREMENT OF PULSED ELECTRIC CURRENTS
G. W. Day, L. R. Veeser, G. I. Chandler, and R. W. Cernosek 1986 13 p Presented at the Conference on Measurement of Electrical Quantities in Pulse Power Systems-2. Gaithersburg, Md. 5 Apr. 1986 Prepared in cooperation with Los Alamos National Lab, N. Mex. and Sandia National Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(DE86-007831; SAND-86-0498C; CONF-860384-6) Avail: NTIS HC A02/MF A01

The state of the art in the design of fiber sensors for pulsed electric currents is reviewed. Some of the more useful configurations are described and compared. Transfer functions are computed and used to illustrate the effect of linear birefringence and twisting on the characteristics of the sensors. The technique of annealing bend-induced birefringence is described and its present capabilities

indicated. An analysis of the ultimate limits to noise equivalent current is given, indicating that several orders of magnitude improvement should be obtainable. DOE

MULTILAYER REFLECTORS FOR THE EXTREME ULTRAVIOLET SPECTRAL REGION
J. B. Kortright Aug. 1985 17 p Presented at the 2nd International Synchrotron Radiation Instrumentation Conference, Standford, Calif., 29 Jul. 1985
(Contract DE-AC03-76SF-00098)
(DE86-008374; LBL-20135; CONF-850734-23) Avail: NTIS HC A02/MF A01

Reflectivity data from Al-Nb multilayers in the 300 to 450 A wavelength range at angles 20 to 50 deg from normal incidence are presented. Constructive interference between the 10 layer-pairs of this structure is observed. Multilayers deposited on a super-polished optical flat had a much higher reflectivity than those deposited on Si (111) wafers. Annealing multilayers on Si at 330(0)C for 3 hr further reduced their reflectivity. Measured peak reflectivities for the multilayer on the super-polished optical flat are 17% and less depending on the angle of incidence. The measured reflectivity is not more than half of that calculated using a model assuming sharp interfaces between elemental materials. The resolution of this device, lambda/(DELTA)lambda approx. = 6 to 7, is in good agreement with the calculated values. DOE

EVIDENCE FOR A NEW INTENSITY FORMULA FROM STANDARD TABLES OF SPECTRAL LINE INTENSITIES
Bo Thelin and Sten Yngstroem Oct. 1985 9 p
(KGI-Preprint-085; ISSN-0349-2656; ESA-86-97224) Avail: NTIS HC A02/MF A01

It is shown that a formula for the intensity of optical emission lines is in very good agreement with experimental results reported in standard tables of spectral data. It is emphasized that the formula is consistent with main features of the spectrum of the Sun. The formula is: I(h nu) = C(h nu) x exp(-J/kT)/(exp(h nu/Kt)-1) where nu is the frequency of the atomic spectral line, J is the ionization energy of the atom, and C(h nu) is a product of factors given by the experimental design (apparatus and sample properties), and the transition probability rate of the atom in the sample. RECOMBINATION AND REACTIONS IN DENSE IONIZED GASES
Final Report, 1 Jan. 1980 - 30 Jun. 1984
M. R. Flannery 10 Dec. 1985 26 p
(Grant AF-AFOSR-0055-80)
(AD-A166190; GIT-85-004; AFOSR-86-0082TR) Avail: NTIS HC A03/MF A01 CSCL 20/9

A list of publications of the research performed during the period 1/1/80-6/30/84 is provided. Theoretical research has been conducted a) on ion-ion recombination in high pressure plasmas, b) on the theory of Rydberg collisions with electrons, ions and neutrals, and c) on the theory of ion-molecule collisions at (1 eV-5 keV)/AMU. Papers in these topics (a)-(c) have been written up and published as papers already submitted to AFOSR. In particular, a new and basic theory of ion-ion recombination in a dense gas has been developed from basic microscopic principles. The recombination rate is provided as a function of gas density and time. The theory has been published in papers already submitted to AFOSR. Appendix A of this report contains the published chapter on Theory of Ion-Molecule collisions at (1 eV-50 keV)/AMU. GRA

ZT-P: AN ADVANCED AIR CORE REVERSED FIELD PINCH PROTOTYPE
Kurt F. Schoenberg, C. J. Buchenauer, L. C. Burkhardt, L. D. Caudill, R. S. Dike, T. Dominguez, J. N. Downing, P. R. Forman, J. A. Garcia, A. J. Giger et al Jan. 1986 67 p
(Contract W-7405-eng-36)
(DE86-007204; LA-10593-MS) Avail: NTIS HC A04/MF A01

The ZT-P experiment, with a major radius of 0.45 m and a minor radius of 0.07 m, was designed to prototype the next generation of reversed field pinch (RFP) machines at Los Alamos. ZT-P utilizes an air-core poloidal field system, with precisely wound and positioned rigid copper coils, to drive the plasma current and provide plasma equilibrium with intrinsically low magnetic field errors. ZT-P's compact configuration is adaptable to test various first wall and limiter designs at reactor-relevant current densities in the range of 5 to 20 MA/m(2). In addition, the load assembly design allows for the installation of toroidal field divertors. Design of ZT-P began in October 1983, and assembly was completed in October 1984. This report describes the magnetic, electrical, mechanical, vacuum, diagnostic, data acquisition, and control aspects of the machine design. In addition, preliminary data from initial ZT-P operation are presented. Because of ZT-P's prototypical function, many of its design aspects and experimental results are directly applicable to the design of a next generation RFP. DOE

STABILIZATION OF MAGNETOHYDRODYNAMIC MODES BY APPLIED RADIOFREQUENCY WAVES
D. A. DIppolito and J. R. Myra Jan. 1986 47 p
(Contract DE-AC03-76ET-53057)
(DE86-008564; SAIC-85/1922; PRI-94) Avail: NTIS HC A03/MF A01

A kinetic theory describing the nonlinear interaction of radiofrequency waves with low frequency magnetohydrodynamic modes is presented. The calculation of the nonlinear force density on a fluid element includes both ponderomotive and sideband mode coupling terms and allows arbitrary rf wave polarization. Electromagnetic effects and wave-particle interactions are retained in the analysis. The influence of the nonlinear force on magnetohydrodynamic plasma stability is calculated self-consistently, and a generalized low mode number ballooning equation is obtained for paraxial magnetic mirror geometry. The low frequency stability problem is thereby shown to involve the coupling of four waves

and the system of governing equations is presented. Specialized limits of the general equations are discussed, and a physical interpretation of rf stabilization is given. It is shown that stability is enhanced by placing the antenna and conducting cavity walls close to the plasma surface. DOE

COMPUTER SIMULATION OF SURFACE AND FILM PROCESSES Final Report, 1 May 1981 - 30 Apr. 1984
W. A. Tiller and M. T. Halicioglu 1 Nov. 1984 75 p
(Contract NCC2-125)
(NASA-CR-176966; NAS 1.26:176966; SU-DMS-85-R-1) Avail: NTIS HC A04/MF A01 CSCL 20L

All the investigations which were performed employed in one way or another a computer simulation technique based on atomistic level considerations. In general, three types of simulation methods were used for modeling systems with discrete particles that interact via well defined potential functions: molecular dynamics (a general method for solving the classical equations of motion of a model system); Monte Carlo (the use of Markov chain ensemble averaging technique to model equilibrium properties of a system); and molecular statics (provides properties of a system at T = 0 K). The effects of three-body forces on the vibrational frequencies of triatomic cluster were investigated. The multilayer relaxation phenomena for low index planes of an fcc crystal was analyzed also as a function of the three-body interactions. Various surface properties for Si and SiC system were calculated. Results obtained from static simulation calculations for slip formation were presented. The more elaborate molecular dynamics calculations on the propagation of cracks in two-dimensional systems were outlined. B.G.

THERMAL AND ELECTRICAL CONTACT CONDUCTANCE STUDIES Final Report, 1 Jun. 1983 - 31 Aug. 1985
S. W. VanSciver and M. Nilles 1985 146 p
(Grant NAG2-242)
(NASA-CR-177093; NAS 1.26:177093) Avail: NTIS HC A07/MF A01 CSCL 20L

Prediction of electrical and thermal contact resistance for pressed, nominally flat contacts is complicated by the large number of variables which influence contact formation. This is reflected in experimental results as a wide variation in contact resistances, spanning up to six orders of magnitude. A series of experiments were performed to observe the effects of oxidation and surface roughness on contact resistance. Electrical contact resistance and thermal contact conductance from 4 to 290 K on OFHC Cu contacts are reported. Electrical contact resistance was measured with a 4-wire DC technique. Thermal contact conductance was determined by steady-state longitudinal heat flow. Corrections for the bulk contribution ot the overall measured resistance were made, with the remaining resistance due solely to the presence of the contact. Author

A NEW MATERIAL WITH GREAT PROSPECT: RAPIDLY SOLIDIFIED MICROCRYSTAL MATERIAL
Shi-Xun Zhang 17 Mar. 1986 6 p Transl. into ENGLISH from Jin Shu Re Chu Li (China), no. 1(n77), 1984 p 15-16
(AD-A166304; FTD-ID(RS)T-1155-85) Avail: NTIS HC A02/MF A01 CSCL 20/2

The main characteristics of the rapidly solidified microcrystal material are: 1) It has a very fine and homogeneous structure. When the cooling rate is 100,000 - 1,000,000 C/s, the size of the crystal grain is about 0.5 to a few micrometers. Its partial resolution is very small. The range of the partial resolution, and the distance between each crystal branch arm is about 0.5-5 micrometers. As the cooling rate increases, the crystal grain can be further refined and the partial resolutin can be further reduced or even eliminated. Because of the very fine and homogeneous structure, the microcrystal material has very good mechanical properties. Compared with ordinary materials, its strength and ductility, stress and corrosion resistance, fatigue fracture resistance, and high temperature oxidation resistance are much higher. 2) The solid solubility is enhanced remarkably. Due to the high cooling rate, the solid solubility of the rapidly solidified material can be increased remarkably. By using the rapid solidification technique, we not only can obtain a high strength material, but more importantly we can also add some metal elements into the metal

alloys, which have some special properties and cannot be obtained ordinarily. GRA

SCANNING PHOTOVOLTAGE TECHNIQUE FOR HIGH RESOLUTION NON-DESTRUCTIVE CHARACTERIZATION OF SEMICONDUCTOR WAFERS Final Report, 2 Jul. 1984 - 2 Jan. 1985
L. J. Palkuti and A. A. Milgram Oct. 1985 42 p
(Contract F33615-84-C-5088)
(AD-A166864; ARACOR-FR-85-351-1; AFWAL-TR-86-4043) Avail: NTIS HC A03/MF A01 CSCL 20/12

Near-surface defects in semiconductor wafers have a primary influence upon device properties, both, the yield and radiation hardness. In phase I of this program, a scanning photovoltage (SPV) technique was experimentally evaluated for the high-resolution, non-destructive identification and mapping of near-surface defects in wafers. The SPV technique shows promise of being useful for this purpose in semi-insulating materials such as GaAs, silicon-on-sapphire and InP. All the goals in the Phase I program were met; experimental apparatus was developed and the differential SPV signal correlated with surface dislocation networks in GaAs wafers. The results strongly support the development and further evaluation of the SPV techniques. The apparatus utilizes an Ar-ion scanning laser system with a programmable x-y table and a focussed laser beam. A photovoltage signal is measured due to the modulated laser beam. Author (GRA)

(AD-A167176; AFOSR-86-0165TR) Avail: NTIS HC A02/MF A01 CSCL 13/8

The automation of Molecular Beam Epitaxy (MBE) system shutters was completed for the substrate and the Mercury, Cadmium Telluride and Telluride sources. As reported earlier, the automated shutter operations allow for much more precise thickness control of the superlattice layers during the deposition. Also, from signal-to-noise considerations, performing the nonlinear optical experiments requires the use of thick (>2 micrometer) superlattice samples which involve several hundred layers of Mercury Telluride and Cadmium Telluride. This can best be accomplished by using an automated Molecular Beam Epitaxy system. The current superlattice design calls for alternate layers of HgTe and CdTe with thicknesses of 100-150 A. A p-type sample with this structure is expected to yield a third order susceptibility (x(3)) of 100 times larger than that of the bulk HgCdTe. A number of test runs were carried out with the automated MBE system. These runs resulted in five superlattice samples of various thicknesses. One sample is now being used in a preliminary experiment of optical phase conjugation to establish baseline data. GRA

The research supported under the present contract has been directed toward an understanding of some basic optical properties in materials of potential importance to the development of electronic devices. One important class of materials studied has been thin films of III-V semi-conductors which are grown using organometallic transport gases. These materials have been investigated using both individual layers and multiple-layer structures. In the layer structures, some effects due to the quantum confinement of electrons have been studied. A second class of materials studied has been amorphous semiconductors. In this class of solids we have investigated diffusion of impurities in oxide glass and amorphous silicon films. Research has also been performed on the effects of light on the optical and structural properties of thin layers of chalcogenide glasses. GRA

PHYSICAL PROCESSES ASSOCIATED WITH RADIATION-INDUCED INTERFACE STATES
Peter S. Winokur, F. Barry McLean, and H. Edwin Boesch, Jr. Apr. 1986 27 p
(AD-A167280; HDL-TR-2081) Avail: NTIS HC A03/MF A01 CSCL 07/4

The buildup of interface states in Al-Si02-Si metal oxide semiconductor capacitors following exposure to pulsed electron beam irradiation has been previously shown to be a two-stage process. In the present work, we further examined the buildup by varying the polarity and magnitude of the field across the oxide during the two stages of the buildup. Specifically, both early (.000001 to 1 s) and late (1 to 10000 s) time regimes are explored. An empirical model of radiation-induced interface states at the Si02/Si interface is presented. The formulation, which explicitly addresses the time-dependent two-stage nature of the buildup process, gives the mathematical dependencies of the experimentally observed buildup on time, field, temperature, and dose. Along with the results of the field-switching experiments, the implications of the empirical model for the microscopic mechanisms involved in the buildup are discussed. In particular, the first stage is attributed to positive ion release in the bulk of the oxide via interactions with radiation-generated holes. The second stage is then associated with the transport of the liberated ions to the Si02/Si interface (for positive gate bias) where a subsequent interaction results in the appearance of electrically observable interface states. GRA

HETEROJUNCTION D(-) (OR A(+)) MILLIMETER AND SUBMILLIMETER WAVE DETECTOR Patent Application
Ben V. Shanabrook and William J. Moore, inventors (to Navy) Filed 27 Nov. 1985 16 p
(AD-D012309; US-Patent-Appl-SN-802286) Avail: NTIS HC A02/MF A01 CSCL 20/12

A solid state detector for use in detecting submillimeter and millimeter for wave radiation. The solid state detector comprises a semilattice of alternating thin epitaxial layers of GaAsl and AlGaAs doped with impurities having the same conductivity type. Eecause of the transfer of charge carriers in order to obtain thermal equilibrium, the charge carriers in the higher energy doped layer transfer to the adjacent lower energy doped layer and form a predetermined number of either D- or + centers in this layer. This D- or A+ center formation is obtained without the use of an optical bias. The ionization energy for these D- or A+ centers is small enough that photons from millimeter or submillimeter wave radiation is sufficient to ionize these carriers and yield a measurable conductivity in the device. BASIC STUDIES OF SUBMICRON LAYERS OF Nb-Al Progress Report
1986 9 p
(Contract DE-FG02-85ER-45206)
(DE86-006985; DOE/ER-45206/2) Avail: NTIS HC A02/MF A01

Recent work with powder metallurgy processed Nb-Al has shown that thin layers of extruded Nb and Al reacted at low temperatures can form superconducting Nb-Al with high transition temperatures well above that expected from the equilibrium phase diagram for Nb-Al and high critical current densities. The basic mechanisms for the low temperature reaction and the importance of surface effects, impurities, and the dependence of layer thickness in Nb-Al are not understood. Purpose of the research program is a basic study of model layered structures of Nb and Al in order to develop an understanding of the basic properties of low temperature reacted Nb-Al. The research employs bilayers and multilayers of Nb and Al to study the effects of layer structures, oxygen, third element additives, proximity, and mechanisms for high critical currents in thin layers. In a controlled manner, the model systems can be studied and analyzed, and made to approach the actual systems produced by powder processing techniques. DOE

MONTE CARLO STABILITY ANALYSIS OF STRAINED LAYER SUPERLATTICE INTERFACES
B. W. Dodson 1985 6 p Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985
(Contract DE-AC04-76DP-00789)
(DE86-007146; SAND-85-1403C; CONF-851217-50) Avail: NTIS HC A02/MF A01

We have developed a procedure, based on conventional Monte Carlo methods, to investigate the limits of stability of a strained layer superlattice (SLS) system as a function of lattice mismatch and layer thickness. The method is demonstrated by the analysis of two-dimensional Lennar-Jones SLS systems, for which the regime of absolute SLS stability is mapped out. Extension of the technique to three-dimensional silicon-like model systems is discussed, and appropriate model potentials for stability analysis of the Si/SiGe system are introduced. DOE

GROWTH OF LARGE GSGG CRYSTALS Final Report
F. J. Bruni Oct. 1985 19 p
(Contract W-7405-eng-48)
(DE86-006700; UCRL-15735) Avail: NTIS HC A02/MF A01

This report describes research intended to study the growth of crystals of gadolinium scandium gallium garnet (Gd3Sc2-Ga3O12) doped with neodymium and chromium. A specific goal of this project was to grow crystals 2.5 inches (6.4 cm) in diameter by 10 inches (25.4 cm) long with chromium and neodymium doping levels of 2 x 10(20) ions/cc each. The growth of undoped crystals of gadolinium scandium gallium garnet (GSGG) was studied as well in order to investigate the general engineering issues associated with the growth of GSGG crystals of this size. IN-SITU SAX INVESTIGATIONS OF ISOTHERMAL CRYSTALLIZATION IN POLY(TMPS) FRACTIONS
J. H. Magill, J. M. Schultz, and J. S. Lin Nov. 1985 46 p Presented at the American Physical Society Meeting, Baltimore, Md., 25 Mar. 1985 Prepared in cooperation with Delaware Univ., Newark and ORNL, Tenn.
(Contract DE-AC05-84OR-21400)
(DE86-003816; CONF-8503216-1) Avail: NTIS HC A03/MF A01

The isothermal crystallization kinetics of poly(TMPS) has been measured by ISSAXS and results obtained for a molecular weight fraction (21,000) below the critical entanglement molecular weight (25,000) and another one above it (371,000). The SAXS intensity vs time curves suggest that a single transformation mechanism exist. The SAXS long period is independent of crystallization time for both poly(TMPS) fractions. However, the interlamellar thickness contribution to the long period is dependent upon molecular weight and crystallization temperature, increasing with temperature and molecular weight. The crystallite contribution also increases over the range studied. Both fractions exhibit a significant, but reversible decrease in thickness on cooling the sample from the crystallization temperature to room temperature and recycling again. The change is more pronounced for 371,000 specimen in keeping with its lower crystallinity. The path dependence of lamellar dimensions has significant implications in the morphological characterization of polymers annealed or crystallized at one temperature and then measured at another one. DIFFRACTION AND MICROSCOPY STUDIES OF THE STRUCTURE OF GRAIN BOUNDARIES IN Fe, Fe-BASE ALLOYS AND CERAMIC MATERIALS Final Technical Report
S. L. Sass Dec. 1985 13 p
(Contract DE-FG02-84ER-45152)
(DE86-007983; DOE/ER-45152/3) Avail: NTIS HC A02/MF A01

This is the final technical report for Contract No. FG02-84ER45152. The long range goal of this research project is to obtain information on the atomic structure of grain boundaries in bcc metals and ceramics, to understand how segregation influences grain boundary structure and causes boundaries to become embrittled in Fe-base alloys, to understand how segregation and the ionization state of the solute influences the boundary structure in ceramic materials, and to study faceting and the frequency of its occurrence in ceramic materials. Electron microscopy and electron diffraction techniques were used to carry out the studies on grain boundaries. Most of the work reported is on influence of Fe solute on the structure of grain boundaries in MgO. DOE

MODIFICATION OF POINT DEFECTS IN QUARTZ FOR DEVICE APPLICATIONS
J. C. King and D. R. Koehler Feb. 1986 10 p
(Contract DE-AC04-76DP-00789)
(DE86-007988; SAND-85-2450) Avail: NTIS HC A02/MF A01

Impurity centers in quartz play a significant role in the behavior of precision crystal resonators subjected to ionizing radiation. The substitutional Al center, charge-compensated by Na, Li, H, or a hole, is now known to be the primary contributing factor in most radiation-induced effects. Acoustic loss measurements, electron spin resonance measurements, optical studies, and infrared studies of these defects, over extended temperature ranges, have contributed substantially to our understanding of the role of impurity centers. Radiation-induced frequency and acoustic loss changes in quartz-crystal resonators are now understood in terms of the evolving character of the defect center in a radiation field. This understanding has prompted such material modifications as high-temperature electrolysis and doping technologies that permit, for instance, the fabrication of frequency control devices that are little affected by hostile environments. DOE

DYNAMIC ASPECTS OF THE DYE-SENSITIZED PHOTOCONDUCTIVITY OF SEMICONDUCTORS Final Technical Report, 1 Apr. 1984 - 31 May 1985
A. M. P. Goncalves 1985 7 p
(Contract DE-AC02-81ER-10881)
(DE86-007662; DOE/ER-10881/1) Avail: NTIS HC A02/MF A01

The work carried out in the current period was a continuation of that done previously under this contract. The goal was to elucidate the dynamics of the processes which determine the efficiency of dye-sensitized semiconductor/electrolyte photoelectrochemical cells. In particular, direct fluorescence lifetime measurements were undertaken to explore the competition between the primary event, electron transfer, and other processes which shorten the lifetime of the dye excited state. SCHOTTKY AND OHMIC Au CONTACTS ON GaAs, MICROSCOPIC AND ELECTRICAL INVESTIGATION
Zuzanna Liliental-Weber, R. Gronsky, J. Washburn, N. Newman (Stanford Univ., Calif.), W. E. Spicer, and E. R. Weber (California Univ., Berkeley.) Feb. 1986 25 p Presented at the Conference on Physics and Chemistry of Semiconductor Interfaces, Pasadena, Calif., 28-30 Jan. 1986 Submitted for publication
(Contract DE-AC03-76SF-00098)
(DE86-007610; LBL-21010; CONF-860159-1) Avail: NTIS HC A02/MF A01

Electrical device measurements and transmission electron microscopy (TEM) methods were used to investigate the electrical, morphological and structural properties of Au/GaAs Schottky diodes. The electrical charcteristics of Au diodes formed on atomically clean and air-exposed GaAs (110) surfaces change from rectifying to ohmic behavior after annealing above the Au-Ga eutectic temperature (360(0)C), owing to an ohmic-like contact at the periphery of the device. TEM indicate that the ohmic peripheral current pathway can be correlated with the formation of near-surface Ga-rich Au crystallites at the diode circumference upon annealing. Removal of these Au crystallites by mesa-etching is also accompanied by the elimination of the ohmic current. The morphology of the overlayer depends strongly on annealing and surface treatment. The interface is flat and abrupt for all unannealed diodes, as well as for annealed diodes formed on atomically clean surfaces. For annealed diodes formed on the air-exposed surfaces, the metal-semiconductor interface contains large metallic protrusions extending up to several hundred Angstroms into the semiconductor. The morphology of annealed diodes formed using typical commercial processing technology (i.e., formed on chemically prepared (100) surfaces annealed in forming gas) was also investigated using TEM. The interface for these structures is more complex than interfaces formed on the atomically clean and air-exposed cleaved (110) surfaces. Au diffuses through the interfacial native oxide layer and forms islands in intimate contact with the semiconductor.DOE

GRAIN GROWTH PHENOMENA IN FILMS: A MONTE CARLO APPROACH
D. J. Srolovitz 1986 23 p Presented at the International Conference on Metallurgical Coatings, San Diego, Calif., 7-11 Apr. 1986 Submitted for publication
(Contract W-7405-eng-36)
(DE86-008755; LA-UR-86-1061; CONF-860495-2) Avail: NTIS HC A02/MF A01

A statistical model of microstructural evolution is developed for the evolution of grain structure during deposition. In cases where the atomic mobility on the surface greatly exceeds that in the bulk of the film, the bulk microstructure may be viewed as static while all of the evolution is controlled by the free surface. This leads naturally to a two-dimensional model of microstructural evolution. Since the surface is advancing at a constant rate during deposition there is a linear relationship between time in the two-dimensional model and depth in the film. A Monte Carlo computer simulation technique is described which models the evolution of microstructure in this way. Various driving forces are included. Simulated microstructures in the plane of the film and in the plane perpendicular to the free surface are shown. DOE

CHARACTERIZATION OF THE IMPURITIES IN TUNGSTEN/SILICON-GERMANIUM CONTACTS
H. A. Gregg, Sr. 26 Mar. 1986 17 p
(Contract DE-AC04-76DP-00656)
(DE86-008791; GEPP-TIS-892) Avail: NTIS HC A02/MF A01

Secondary ion mass spectrometry and Auger electron spectrometry depth profiling were used to determine impurity distributions in sputter deposited tungsten films over N-type and P-type 80/20 silicon-germanium elements of thermoelectric devices. These analyses showed that silicon, oxygen, sodium, boron, and phosphorous were present as impurities in the tungsten film. All these impurities except oxygen and sodium came from the substrate. Oxygen was gettered by the tungsten films, while sodium was possibly the result of sample handling. Further, the results from this study indicate that an oxide build-up, primarily at the tungsten/silicon-germanium interface of the N-type materials, is the major contributor to contact resistance in thermoelectric devices. SIPOS HETEROJUNCTION CONTACTS TO SILICON
Young H. Kwark and R. M. Swanson Feb. 1986 275 p
(Contract DE-AC04-76DP-00789)
(DE86-008879; SAND-85-7022) Avail: NTIS HC A12/MF A01

Deliberate introduction of controlled amounts of an oxygen-bearing species such as nitrous oxide into the deposition ambient normally used for chemical vapor deposition of polysilicon produces SIPOS, a class of silicon oxides that exhibits a wide range of physical properties is discussed. It is possible to tailor SIPOS film characteristics such as refractive index by altering the oxygen partial pressure in the deposition ambient. The addition of a dopant species converts these films from semi-insulating to a form that can be made sufficiently conductive after annealing to make them interesting for electronic applications. The potential for conveniently altering the effective mobility gap in this material suggests its use in heterojunction contact structures to silicon. Incorporation of these films into the emitter structure of an NPN bipolar transistor has been found to reduce the emitter saturation current fifty fold. This suppression of reverse injected hole transport has often been assumed to be the result of a wider gap in the SIPOS due to the presence of incorporated oxygen. However, this seems to be an oversimplification in view of microstructural studies that revealed a multi-phase structure consisting of a fine dispersion of silicon microcrystals embedded in an oxide-like matrix. INELASTIC SCATTERING IN CONDENSED MATTER WITH HIGH INTENSITY MOSSBAUER RADIATION Annual Report, 1 Mar. 1985 - 28 Feb. 1986
W. B. Yelon and G. Schupp Feb. 1986 9 p
(Contract DE-FG02-85ER-45200)
(DE86-007007; DOE/ER-45200/2) Avail: NTIS HC A02/MF A01

The past year has seen the completion of most of the design and construction phases of our instrument development and the beginning of our scientific investigations. Many technical difficulties relating to mechanical strains in the source cryostat and in the MICE detector assembly caused by cycling them between 300 and 100 K have been overcome. The scientific work has been highlighted by the performance of the MICE director and how it has allowed us to measure the asymmetry parameters in (183)W and (182)W much more reliably than in the past and by the high momentum resolution made possible with our intense sources as demonstrated by studies on Si. Quasielastic scattering in a liquid metal is planned as well as investigation of interference and time reversal parameters in (182)W (100 keV), (183)W (46.5 keV), (197)Au (77 keV), and (193)Ir (73 keV). Additional work on the TaS2 1T using the 46.5 keV transition in (183)W is also planned in an effort to explore the already-observed anomaly at the 79(0)C incommensurate to quasi-commensurate transition. CRYSTALLIZATION OF SPUTTER DEPOSITED AMORPHOUS METAL THIN FILMS
R. E. Thomas, J. H. Perepezko, and J. D. Wiley 1985 16 p
Presented at the AVS Tri-state Symposium on Surface Analysis and Thin Film Technology, Oconomowoc, Wisc., 1 Apr. 1985
(Contract DE-FG02-84ER-45096)
(DE86-008958; CONF-8504224-1) Avail: NTIS HC A02/MF A01

Au overlayers on W-Si can reduce the crystallization temperatures by 100(0)C. In this paper we report on further work done on the W-Si system. Using Differential Thermal Analysis (DTA) we have measured the crystallization temperature versus composition from approximately 5 at. % Si to 40 at. % Si. Additional overlayers of W, Cu, and Al have been investigated. Both the W and Cu overlayers appear to have little effect on the stability of the underlying W-Si, while the Al reduces the crystallization temperature by at least 100(0)C. These results reinforce the observation that the choice of overlayer plays a critical role in determining the overall stability of the metallization, and indicate that W-Si is a viable candidate for diffusion barriers on silicon. CORE LEVEL SHIFTS IN SEMICONDUCTORS: A STUDY OF THE ELECTROSTATIC MODEL
Xuefu Zhong Aug. 1984 11 p
(DE85-703224; IC-84/120) Avail: NTIS (US Sales Only) HC A02/MF A01

A different electrostatic model is proposed for core level shift calculation in semiconductors on the basis of a critical analysis of so called bond charge model by Bechstedt et al. The population of valence charge on anion and on cation is no longer a linear function of Phillips ionicity, f sub (i), and a set of additive covalent radii is used instead of a nonadditive one. A phenomenological expression is given for bond charge which decreases as ionicity, f sub (i), increases. The results are in agreement with experiments, and the reasons for errors are explained. DOE

RESEARCH PROGRAM WITH NO MEASUREMENT PROBLEM
H. P. Noyes, C. Gefwert, and M. J. Manthey Jul. 1985 10 p
Presented at the Conference on New Techniques and Ideas in Quantum Measurement Theory, New York, N.Y., 21 Jan. 1986
Prepared in cooperation with Suomen Akatemia, Helsinki (Finland) and New Mexico Univ., Albuquerque
(Contract DE-AC03-76SF-00515)
(DE86-006952; SLAC-PUB-3734; CONF-860147-1) Avail: NTIS HC A02/MF A01

The measurement problem of contemporary physics is met by recognizing that the physicist participates when constructing and when applying the theory consisting of the formulated formal and measurement criteria (the expressions and rules) providing the necessary conditions which allow him to compute and measure facts, yet retains objectivity by requiring that these criteria, rules and facts be in corroborative equilibrium. We construct the particulate states of quantum physics by a recursive program which incorporates the non-determinism born of communication between asynchronous processes over a shared memory. Their quantum numbers and coupling constants arise from the construction via the unique 4-level combinatorial hierarchy. The construction defines indivisible quantum events with the requisite supraluminal correlations, yet does not allow supraluminal communication. Measurement criteria incorporate c, h-bar, and m/sub p/ or (not and) G. The resulting theory is discrete throughout, contains no infinities, and, as far as we have developed it, is in agreement with quantum m echanical and cosmological fact. DOE

OBTAINING THE EINSTEIN-HILBERT ACTION FROM A SUPERCONFORMAL THEORY
C. H. Pilot Jan. 1986 41 p
(Contract DE-FG05-85ER-40215)

(DE86-009007; DOE/ER-40215/T3) Avail: NTIS HC A03/MF A01

By breaking the superconformal group it is possible to obtain an Einstein-Hilbert type action starting from one quadratic in the curvatures. The Newtonian gravitational constant is interpreted as a ratio of order parameters; at present low energies, these approach constant values of inherent dimension (much like the magnetization in a ferromagnet). Radiative corrections are forwarded as the mechanism responsible for spontaneous symmetry breaking (SSB). DOE

N86-31407# Oklahoma State Univ., Stillwater. Dept. of Physics.

CONCERNING THE TRANSFORMATION BEHAVIOR OF FIELDS UNDER THE SUPERCONFORMAL SYMMETRIES

C. H. Pilot Dec. 1985 29 p

(Contract DE-FG05-85ER-40215)

(DE86-009008; DOE/ER-40215/T1) Avail: NTIS HC A03/MF A01

The transformation behavior of fields under external type symmetries (such as the superconformal group) is gone over emphasizing the formal distinction between the group transformations of fields and their Lie transformations (often called Lie derivatives). We show how some of the standard results ordinarily expected for the Poincare group have to be generalized if the full symmetries of the superconformal group are to be respected. As far as classical scalar field theories go only massless phi(4) theories are superconformally invariant. DOE

COMPUTATION OF ADIABATIC FLAME TEMPERATURES AND OTHER THERMODYNAMIC QUANTITIES

C. K. Westbrook 15 Apr. 1986 30 p Presented at the Symposium on Industrial Combustion Technology, Chicago, Ill., 29 Apr. 1986

(Contract W-7405-eng-48)

(DE86-009388; UCRL-94450; CONF-8604156-1) Avail: NTIS HC A03/MF A01

The equilibrium final temperature and composition of a given fuel-oxidizer mixture have both theoretical and practical importance for helping to understand the behavior of combustion systems. Both are needed in order to estimate levels of chemical pollutants such as oxides of nitrogen (NO sub x), and the final temperature is necessary to predict the expected thermal efficiency and heating value of a given combustor. Knowledge of the ways that various radical and stable intermediate chemical species vary as operating conditions are changed can also suggest system modifications to improve overall performance. In this paper, the methods available for computing chemical equilibrium conditions such as adiabatic flame temperatures will be reviewed. The dependence of computed values on available thermochemical data bases will be demonstrated. Examples of equilibrium flame temperatures and compositions for mixtures of interest and importance in natural gas combustion will be presented. DOE

Mossbauer Spectroscopy (MS) has recently been added to the tools used by Dr. Richard Morris of the Experimental Planetology Branch of the Solar System Exploration Division at Johnson Space Flight Center in his research on synthetic and natural analogs of lunar and Martian soils. A least-squares fitting program for MS data written originally for an IBM 360 Mainframe computer was adapted for use on an IBM-PC microcomputer. The adapted program has been applied to the analysis of MS spectra obtained from several samples of Antarctic soil under investigation at JSC as analogs to soil of the Martian regolith. Preliminary conclusions have been drawn from the MS data about the composition of the Antarctic samples. Inferences from optical spectra obtained for these same samples have been compared with the MS results. Author

Knowledge based expert systems are applicable to a wide range of engineering problems ranging from formation to derivation. At the formation end of the spectrum, design, planning and prediction have been identified as generic tasks with similar issues that are dealt with by experts, and need to be formalized for successful expert system implementation. At the derivation end, diagnosis, interpretation and monitoring have been identified as generic tasks with similar subproblems with which experts must cope. At the implementation level, four levels of programming have been identified: logic programming, production system programming, object oriented programming and hybrid programming. Author

EVALUATING SPACE STATION APPLICATIONS OF AUTOMATION AND ROBOTICS TECHNOLOGIES FROM A HUMAN PRODUCTIVITY POINT OF VIEW **c54**

Jonathan F. Bard *In its* NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 46 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 05H

The role that automation, robotics, and artificial intelligence will play in Space Station operations is now beginning to take shape. Although there is only limited data on the precise nature of the payoffs that these technologies are likely to afford there is a general consensus that, at a minimum, the following benefits will be realized: increased responsiveness to innovation, lower operating costs, and reduction of exposure to hazards. Nevertheless, the question arises as to how much automation can be justified with the technical and economic constraints of the program? The purpose of this paper is to present a methodology which can be used to evaluate and rank different approaches to automating the functions and tasks planned for the Space Station. Special attention is given to the impact of advanced automation

on human productivity. The methodology employed is based on the Analytic Hierarchy Process. This permits the introduction of individual judgements to resolve the confict that normally arises when incomparable criteria underly the selection process. Because of the large number of factors involved in the model, the overall problem is decomposed into four subproblems individually focusing on human productivity, economics, design, and operations, respectively. The results from each are then combined to yield the final rankings. To demonstrate the methodology, an example is developed based on the selection of an on-orbit assembly system. Five alternatives for performing this task are identified, ranging from an astronaut working in space, to a dexterous manipulator with sensory feedback. Computational results are presented along with their implications. A final parametric analysis shows that the outcome is locally insensitive to all but complete reversals in preference. Author

DISTRIBUTED SYNTHETIC APERTURE RADAR SIMULATION **c32**

Brian A. Bourgeois *In* NASA. Johnson Space Center NASA/American Society for Engineering Educaqtion (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 8 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 17I

Synthetic aperture radar (SAR) depends primarily on attainable frequency resolution rather than on large physical size of the antenna array. The distributed architecture concept (DSAR) incorporates active elements (amplifiers) at or near the elemental radiators of the array. Since SAR's are expensive to build and expensive to test, a computer modeling approach is a feasible method of predicting the quality or nature of the SAR image from the proposed system parameters. The goal of this project is to produce a DSAR simulation software package. This report describes the progress made thus far and the work which remains to be done. Extensive work on this project had been done previously by two NASA contractors. The principal task remaining involved the creation of a suitable interface between these programs and the hardware and software available at the Johnson Space Center. Author

CONDENSATION HEAT TRANSFER UNDER A MICROGRAVITY ENVIRONMENT **c34**

L. C. Chow *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 24 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 20D

A description of the condensation heat transfer process in microgravity is given. A review of the literature is also reported. The most essential element of condensation heat transfer in microgravity is the condensate removal mechanism. Two mechanisms for condensate removal are analyzed by looking into two problems. The first problem is concerned with film condensation on a flat porous plate with the condensate being removed by suction at the wall. The second problem is an analytical prediction of the heat transfer coefficient for condensing annular flows with the condensate film driven by the vapor shear. It is concluded that both suction and vapor shear can effectively drain the condensate to ensure continuous operation of the condensers operated under a microgravity environment. It is recommended that zero-g flight experiments be carried out to verify the prediction made in the present report. The results contained in this report should also aid in the design of future space condensers. Author

CHRONOLOGY AND ISOTOPIC GEOCHEMISTRY OF APOLLO 14 BASALTS AND SKAERGARD GABBRO, EASTERN GREENLAND Final Report **c91**

E. Julius Dasch *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 6 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 03B

Work completed on Apollo 14 basalts has been published. The two dates obtained from these rocks comprised the oldest and two of the three oldest ages (4.1 and 4.3 billion years) known for lunar maria basalts; thus their ages are important in understanding the moon's earliest history. Wing to the antiquity of these rocks, two more fragments have been dated as part of a second ASEE/NASA SFF program. The new ages are 3.95 and 4.12 billion years, thus further establishing and amplifying the earlier results. This work, although perhaps more interesting for its chronologic information, was begun as a test of chemical and petrographic models. Fragments of Apollo basalt were placed into five categories, based on petrologic and chemical, especially rare-earth element, composition. Isotopic studies were begun in an attempt to determine if the five groups of basalts were related by age or initial isotopic composition (isotopic composition of lava at time of extrusion). Although a few of the representatives of the five groups have the same age and/or initial strontium-isotopic composition, within the analytical uncertainties, most apparently are unrelated. Petrologic implications of these data will be published in an appropriate journal. Author

APPLICATION OF COMPUTER IMAGE ENHANCEMENT TECHNIQUES TO SHUTTLE HAND-HELD PHOTOGRAPHY **c35**

Bruce E. David *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 69 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 14E

With the advent of frequent Space Transportation System Shuttle missions, photography from hyperaltitudes stands to become an accessible and convenient resource for scientists and environmental managers. As satellite products (such as LANDSAT) continue to spiral in costs, all but the most affluent consumer is finding Earth imagery from space to be more and more unavailable. Therefore, the potential for Shuttle photography to serve a wide variety of users is increasing. However, despite the popularity of photos from space as public relations tools and report illustrations, little work has been performed to prove their scientific worth beyond that as basic mapping bases. It is the hypothesis of this project that hand-held Earth photography from the Space Shuttle has potentially high scientific merit and that primary data can be extracted. In effect, Shuttle photography should be considered a major remote sensing information resource. Author

INVESTIGATION OF LOCAL AREA NETWORKS FOR AN ORBITING SPACE STATION Final Report **c62**

Louis A. DeAcetis *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 4 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 09B

An investigation and test of various equipment was conducted to determine its state of repair and suitability for use in a test-bed computer network (to be used to simulate a space station configuration of computers for control and monitoring). A research study was also made of various network types, including the IEEE network standards: (1) Carrier Sense Multiple Access with Collision Detection. (2) Token Passing Bus (3) Token Passing Ring, and (4) the draft ANSI standard for a High Speed Local Network CSMA with Collision Avoidance. No firm conclusions are possible at this time as to which would be most suitable. An evaluation of the user interface of a space station database program, FREDSS (Formatted Retrieval and Entry of Data for Space Station preliminary version), was also conducted and recommendations were made for possible improvements. AN IBM PC-BASED MATH MODEL FOR SPACE STATION SOLAR ARRAY SIMULATION c44
Ervin M. Emanuel *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 28 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 10A

This report discusses and documents the design, development, and verification of a microcomputer-based solar cell math model for simulating the Space Station's solar array Initial Operational Capability (IOC) reference configuration. The array model is developed utilizing a linear solar cell dc math model requiring only five input parameters: short circuit current, open circuit voltage, maximum power voltage, maximum power current, and orbit inclination. The accuracy of this model is investigated using actual solar array on orbit electrical data derived from the Solar Array Flight Experiment/Dynamic Augmentation Experiment (SAFE/DAE), conducted during the STS-41D mission. This simulator provides real-time simulated performance data during the steady state portion of the Space Station orbit (i.e., array fully exposed to sunlight). Eclipse to sunlight transients and shadowing effects are not included in the analysis, but are discussed briefly. Integrating the Solar Array Simulator (SAS) into the Power Management and Distribution (PMAD) subsystem is also discussed. Author

FIRE CONTROL METHOD AND ANALYTICAL MODEL FOR LARGE LIQUID HYDROCARBON POOL FIRES c25
Donald L. Fenton *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 14 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 21B

The dominate parameter governing the behavior of a liquid hydrocarbon (JP-5) pool fire is wind speed. The most effective method of controlling wind speed in the vicinity of a large circular (10 m dia.) pool fire is a set of concentric screens located outside the perimeter. Because detailed behavior of the pool fire structure within one pool fire diameter is unknown, an analytical model supported by careful experiments is under development. As a first step toward this development, a regional pool fire model was constructed for the no-wind condition consisting of three zones -- liquid fuel, combustion, and plume -- where the predicted variables are mass burning rate and characteristic temperatures of the combustion and plume zones. This zone pool fire model can be modified to incorporate plume bending by wind, radiation absorption by soot particles, and a different ambient air flow entrainment rate. Results from the zone model are given for a pool diameter of 1.3 m and are found to reproduce values in the literature. Author

DEVELOPMENT OF A NUMERICAL PROCEDURE TO MAP A GENERAL 3-D BODY ONTO A NEAR-CIRCLE c64
Mark J. Hommel *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 5 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 12A

Conformal mapping is a classical technique utilized for solving problems in aerodynamics and hydrodynamics. Conformal mapping is utilized in the construction of grids around airfoils, engine inlets and other aircraft configurations. These shapes are transformed onto a near-circle image for which the equations of fluid motion are discretized on the mapped plane and solved numerically by utilizing the appropriate techniques. In comparison to other grid-generation techniques such as algerbraic or differential type, conformal mapping offers an analytical and accurate form even if the grid deformation is large. One of the most appealing features is that the grid can be constrained to remain orthogonal to the body after the transformation. Hence, the grid is suitable for analyzing the supersonic flow past a blunt object. The associated shock as a coordinate surface adjusts its position in the course of computation until convergence is reached. The present work applied conformal mapping to 3-D bodies with no axis of symmetry such as the Aerobraking Flight Experiment (AFE) vehicle, transforming the AFE shape onto a near-circle image. A numerical procedure and code are used to generate grids around the AFE body. Author

EFFECTS OF LUNAR SOIL, ZAGAMI METEORITE, AND OCEAN RIDGE BASALT ON THE EXCRETION OF ITOIC ACID, A SIDEROPHORE, AND COPROPORPHYRIN BY BACILLUS SUBTILIS c55
Takeru Ito *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 12 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 06C

Samples of lunar soil (10084,151), Zagami meteorite, postulated to be ejected from Mars, and ocean ridge basalt, the most abundant volcanic rock on earth, all completely inhibited the excretion of itoic acid and of coproporphyrin by Bacillus subtilis, a common airborne bacterium. Since such inhibition has been known to occur only under iron rich growth conditions(the excretion of these compounds occurs under iron deficient growth conditions), the result indicated that the organism was capable of extracting iron quite readily from these materials. A sample of synthetic ilmenite completely failed to inhibit the excretion of coproporphyrin, and inhibited the excretion of itoic acid only slightly. The result suggested that much of the iron extracted by the organism must have come from iron sources other than ilmenite,such as pyroxenes and olivines,in these natural materials tested. Author

DEFINING RECLAIMED WATER POTABILITY REQUIREMENTS c54
Daniel S. Janik *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 49 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 06K

Water used during previous space missions has been either carried or made aloft. Future human space endeavors will probably have to utilize some form of water reclamation and recycling. There is little applied experience in either the US or foreign space programs with this technology. Water reclamation and recycling constitutes an engineering challenge of the broadest nature and will require an intensive research and development effort if this technology is to mature in time for practical use on the proposed US spacestation. In order for this to happen, reclaimed/recycled water specification will need to be devised to guide engineering development. Perhaps the most strigent specifications will involve water to be consumed. NASA's present Potable Water Specifications are not applicable to reclaimed or recycled potable water. No specifications for reclaimed or recycled potable water presently exist either inside or outside NASA. NASA's past experience with potable water systems is reviewed, limitations of the present Potable Water Specifications are examined, present world expertise with potable water reclamation/recycling systems and system analogs is reviewed, and an approach to developing pertinent Reclaimed/Recycled Potable Water Specifications for spacecraft is presented. REVIEW AND ANALYSIS OF HIGH TEMPERATURE CHEMICAL REACTIONS AND THE EFFECT OF NON-EQUILIBRIUM CONDITIONS c25

Richard E. Johnson *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 19 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 07D

Chemical reactions at high temperatures have been considered extensively because of their importance to the heating effects on re-entry of space vehicles. Data on these reactions however, are not abundant and even when found there are discrepancies in data collected by various investigators. In particular, data for recombination reactions are calculated from the dissociation reactions or vice versa through the equilibrium constant. This involves the use of the principle of detailed balancing. This principle is discussed in reference to conditions where it is valid as well as to those where it is not valid. Related topics that merit further study or for which applicable information was available are briefly mentioned in an appendix to this report. Author

AN ANALYSIS OF ULLAGE HEAT TRANSFER IN THE ORBITAL REFUELING SYSTEM **c34**
David Kauffman *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 74 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 20D

The Orbital Refueling System was an experiment flown on Shuttle Mission STS 41-G in October, 1984. Liquid hydrazine fuel was transferred back and forth from one spherical bladder tank to another using pressurized nitrogen as the driving force. Compressive heating of the ullage gas in the receiving tank could lead to a hazardous situation if any hydrazine leaked through to the ullage side of the bladder and was heated above about 175 F, where it can undergo spontaneous exothermic decomposition. Early analysis of the flight data indicated that the ullage compression process was much closer to an isothermal than an adiabatic one. In this study, a thorough review of the pertinent literature was used to make an a priori best-estimate for the ullage gas heat transfer coefficient (defining the Nusselt Number as a function of Reynolds and Rayleigh Numbers). Experimental data from the flight were analyzed in detail. It is evident that there is considerably more heat transfer than can be accounted for by conduction alone, but the observed increases do not correlate well with Reynolds Number, Rayleigh Number or vehicle acceleration. There are large gaps in the present understanding of convective heat transfer in closed containers with internal heat generation, especially in the presence of vibrations or other random disturbances. A program of experiments to fill in these gaps is suggested, covering both ground and orbital environments. Author

ENGINEERING GRAPHICS DATA ENTRY FOR SPACE STATION DATA BASE **c31**
R. C. Lacovara *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 13 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 13B

The entry of graphical engineering data into the Space Station Data Base was examined. Discussed were: representation of graphics objects; representation of connectivity data; graphics capture hardware; graphics display hardware; site-wide distribution of graphics, and consolidation of tools and hardware. A fundamental assumption was that existing equipment such as IBM based graphics capture software and VAX networked facilities would be exploited. Defensible conclusions reached after study and simulations of use of these systems at the engineering level are: (1) existing IBM based graphics capture software is an adequate and economical means of entry of schematic and block diagram data for present and anticipated electronic systems for Space Station; (2) connectivity data from the aforementioned system may be incorporated into the envisioned Space Station Data Base with modest effort; (3) graphics and connectivity data captured on the IBM based system may be exported to the VAX network in a simple and direct fashion; (4) graphics data may be displayed site-wide on VT-125 terminals and lookalikes; (5) graphics hardcopy may be produced site-wide on various dot-matrix printers; and (6) the system may provide integrated engineering services at both the engineering and engineering management level. ANALYSIS OF NYSTAGMUS RESPONSE TO A PSEUDORANDOM VELOCITY INPUT **c52**
Charles S. Lessard *In* NASA. Johnson Space Center NASA/American Soceity for Engineering Eduction (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 104 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 06P

Space motion sickness was not reported during the first Apollo missions; however, since Apollo 8 through the current Shuttle and Skylab missions, approximately 50% of the crewmembers have experienced instances of space motion sickness. Space motion sickness, renamed space adaptation syndrome, occurs primarily during the initial period of a mission until habilation takes place. One of NASA's efforts to resolve the space adaptation syndrome is to model the individual's vestibular response for basis knowledge and as a possible predictor of an individual's susceptibility to the disorder. This report describes a method to analyse the vestibular system when subjected to a pseudorandom angular velocity input. A sum of sinusoids (pseudorandom) input lends itself to analysis by linear frequency methods. Resultant horizontal ocular movements were digitized, filtered and transformed into the frequency domain. Programs were developed and evaluated to obtain the (1) auto spectra of input stimulus and resultant ocular resonse, (2) cross spectra, (3) the estimated vestibular-ocular system transfer function gain and phase, and (4) coherence function between stimulus and response functions. MATERIALS CONSIDERATIONS IN THE DESIGN OF A METAL-HYDRIDE HEAT PUMP FOR AN ADVANCED EXTRAVEHICULAR MOBILITY UNIT **c34**
Bruce E. Liebert *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 62 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 20D

A metal-hydride heat pump (HHP) has been proposed to provide an advanced regenerable nonventing thermal sink for the liquid-cooled garment worn during an extravehicular activity (EVA). The conceptual design indicates that there is a potential for significant advantages over the one presently being used by shuttle crew personnel as well as those that have been proposed for future use with the space station. Compared to other heat pump designs, a HHP offers the potential for extended use with no electrical power requirements during the EVA. In addition, a reliable, compact design is possible due to the absence of moving parts other than high-reliability check valves. Because there are many subtleties in the properties of metal hydrides for heat pump applications, it is essential that a prototype hydride heat pump be constructed with the selected materials before a committment is made for the final design. Particular care must be given to the evaporator heat exchanger worn by the astronaut since the performance of hydride heat pumps is generally heat transfer limited. Author

FLOW CYTOMETRY ANALYSIS OF HORMONE RECEPTORS ON HUMAN PERIPHERAL BLOOD MONONUCLEAR CELLS TO

IDENTIFY STRESS-INDUCED NEUROENDOCRINE EFFECTS c52

Richard T. Meehan *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 7 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 06P

Understanding the role of circulating peptide hormones in the pathogenesis of space-flight induced disorders would be greatly facilitated by a method which monitors chronic levels of hormones and their effects upon in vivo cell physiology. Single and simultaneous multiparameter flow cytometry analysis was employed to identify subpopulations of mononuclear cells bearing receptors for ACTH, Endorphin, and Somatomedin-C using monoclonal antibodies and monospecific antisera with indirect immunofluorescence. Blood samples were obtained from normal donors and subjects participating in decompression chamber studies (acute stress), medical student academic examination (chronic stress), and a drug study (Dexamethasone). Preliminary results indicate most ACTH and Endorphin receptor positive cells are monocytes and B-cells, exhibit little diurnal variation but the relative percentages of receptor positive cells are influenced by exposure to various stressors and ACTH inhibition. This study demonstrates the capability of flow cytometry analysis to study cell surface hormone receptor regulation which should allow insight into neuroendocrine modulation of the immune and other cellular systems during exposure to stress or microgravity.

AUTOMATION OF REVIEW/APPROVAL CYCLE OF MCAUTO CAD/CAM GENERATED DRAWINGS AND DOCUMENTS c61

Howard S. Minn *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 17 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 09B

The review/approval of MCAUTO/UNIGRAPHICS CAD/CAM generated drawings and documents is done through routing of hard copies of drawings and memos via mail, a process both time consuming and expensive. It is proposed that a set of procedures and the required software tools be designed for transmission, revision, and signing-off of such documents via electronic data transfer, while maintaining a sufficient degree of data integrity and individual security. A main resistance to such a technique will be the limited size of the display screen (19 inch class) and infrequent layer switching with the attendant time delay during the process of reviewing the drawing. Such opposition should diminish as the users become familiar with the hardwares and its operation. It is suggested that user profiles be set so that the protection class list of the originator of the drawing include at least one common class with each of the individuals who will be involved in the Revision/Approval cycle. In this way the originator will be able to tranfer a file for their review and also be able to copy back the file to make the necessary permanent changes. Individual security is maintained by restricted access to signature files and by restricting the list of individuals who will be authorized to sign off. This is accomplished through two software tools: LAYCOPY and SIGN. It is felt that these proposed procedures and techniques will adequately maintain both the file integrity and individual security during Review/Approval Cycle of MCAUTO generated drawings without the need for hardcopy routing. THERMALLY REGENERATIVE HYDROGEN/OXYGEN FUEL CELL POWER CYCLES c44

Jeffrey H. Morehouse *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 28 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 10B

Two innovative thermodynamic power cycles are analytically examined for future engineering feasibility. The power cycles use a hydrogen-oxygen fuel cell for electrical energy production and use the thermal dissociation of water for regeneration of the hydrogen and oxygen. The TDS (thermal dissociation system) uses a thermal energy input at over 2000 K to thermally dissociate the water. The other cycle, the HTE (high temperature electrolyzer) system, dissociates the water using an electrolyzer operating at high temperature (1300 K) which receives its electrical energy from the fuel cell. The primary advantages of these cycles is that they are basically a no moving parts system, thus having the potential for long life and high reliability, and they have the potential for high thermal efficiency. Both cycles are shown to be classical heat engines with ideal efficiency close to Carnot cycle efficiency. The feasibility of constructing actual cycles is investigated by examining process irreversibilities and device efficiencies for the two types of cycles. The results show that while the processes and devices of the 2000 K TDS exceed current technology limits, the high temperature electrolyzer system appears to be a state-of-the-art technology development. The requirements for very high electrolyzer and fuel cell efficiencies are seen as determining the feasbility of the HTE system, and these high efficiency devices are currently being developed. It is concluded that a proof-of-concept HTE system experiment can and should be conducted. Author

CYTOGENETIC ANALYSES OF PERIPHERAL LYMPHOCYTES SUBJECTED TO SIMULATED SOLAR FLARE RADIATION c55

Howard M. Prichard *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 9 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 06R

Solar flare protons share many radiological health characteristics of the inner Van Allen Belt protons, and both types of radiation pose serious dangers to a number of missions planned. It is appropriate to evaluate crew dose determination procedures in terms of the type of radiation responsible for the major part of the projected exposure, i.e., protons in the neighborhood of 100 MeV Monitoring chromosome abnormalities in peripheral lymphocytes is one method to determine an individual's accumulated radiation dosage. Cell culture and harvest is a relatively simple procedure and is well within the capabilities of a station health facility, but the evaluation of prepared microscopic slides is a time consuming and subjective procedure. This project is part of an effort to demonstrate the utility of automated image processing and evaluation procedures in expediting dose evaluation. The initial goal of this project is to produce a set of reference chromosome spreads produced from control lymphocytes and from lymphocytes exposed in whole blood to protons or gamma rays. The results of manual and automated aberration scoring will ultimately be compared to test for systematic differences between the two evaluation procedures and between the two radiation qualities. Proton irradiations are performed at the University of Texas Health Science Center at Houston Cyclotron Facility. Proton dosimetry is supplemented by TLD packets from and by assay of short-lived proton activation products in the irradiation blood samples. Author

INTEGRATION OF AN EXPERT SYSTEM INTO A USER INTERFACE LANGUAGE DEMONSTRATION c61

Daniel C. StClair *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program. 1985 Jul. 1986 47 p (For primary document see N86-31409 22-80)

Avail: NTIS HC A99/MF E03 CSCL 09B

The need for a User Interface Language (UIL) has been recognized by the Space Station Program Office as a necessary tool to aid in minimizing the cost of software generation by multiple users. Previous history in the Space Shuttle Program has shown that many different areas of software generation, such as operations, integration, testing, etc., have each used a different

user command language although the types of operations being performed were similar in many respects. Since the Space Station represents a much more complex software task, a common user command language--a user interface language--is required to support the large spectrum of space station software developers and users. To assist in the selection of an appropriate set of definitions for a UIL, a series of demonstration programs was generated with which to test UIL concepts against specific Space Station scenarios using operators for the astronaut and scientific community. Because of the importance of expert system in the space station, it was decided that an expert system should be embedded in the UIL. This would not only provide insight into the UIL components required but would indicate the effectiveness with which an expert system could function in such an environment.

IN VITRO CYTOGENETIC STUDIES OF ORGANIC CHEMICALS FOUND AS CONTAMINANTS IN SPACECRAFT CABIN ATMOSPHERES c45
Joseph Torres *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 6 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 13B

Astronauts can be exposed during spaceflight to organic chemical contaminants in the spacecraft cabin atmosphere. Toxic exposures may cause lesions in the cellular DNA which are subsequently expressed as sister-chromatid exchanges (SCE). Analysis of SCE is a sensitive short-term assay technique to detect and quantitate exposures to DNA-damaging (mutagenic) substances. The increase in SCE incidence over baseline (control) levels is generally proportional to the concentration of the mutagen and to the duration of exposure. Dichloromethane (methylene chloride) was chosen for this study since it occurred as an atmospheric contaminant in ten of the first 12 STS flights, and has been reported to have toxic and mutagenic effects in various test systems. Glutaraldehyde was chosen because relatively few data are available on the toxicity or mutagenicity of this common biological fixative, which is carried on STS flights for use in biological experiments. The BHK-21 baby hamster kidney cell line was the in vitro test system used in this study. Neither dichloromethane (10 ppm to 500 ppm) nor glutaraldehyde (1 ppm to 10 ppm) increased SCE levels following 20-hour exposure of BHK-21 cells to the test chemicals.

CSTAR STAR CATALOGUE DEVELOPMENT c89
Jo A. Uhde-Lacovara *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 14 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 03A

The Continuous Stellar Tracking Attitude Reference (CSTAR) system is an in-house project for the Space Station to provide high accuracy, drift free attitude and angular rate information for the GN&C system. Constraints exist on the star catalogue incorporated in the system. These constraints include the following: mass memory allocated for catalogue storage, star tracker imaging sensitivity, the minimum resolvable separation angle between stars, the width of the field of view of the star tracker, and the desired number of stars to be tracked in a field of view. The Smithsonian Astrophysical Observatory (SAO) catalogue is the basis reference for this study. As it stands, the SAO does not meet the requirements of any of the above constraints. Star selection algorithms have been devised for catalogue optimization. Star distribution statistics have been obtained to aid in the development of these rules. VAX based software has been developed to implement the star selection algorithms. The software is modular and provides a design tool to tailor the catalogue to available star tracker technology. The SAO catalogue has been optimized for the requirements of the present CSTAR system.

LASER TECHNIQUES FOR ARC JET PLASMA DIAGNOSTICS; CONTINUATION OF A FEASIBILITY AND DESIGN STUDY c75
F. A. Wierum *In* NASA. Johnson Space Center NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 Jul. 1986 33 p (For primary document see N86-31409 22-80)
Avail: NTIS HC A99/MF E03 CSCL 20I

This study is concerned with the continuation of a feasibility and design study of laser-based diagnostic techniques for the non-instrusive measurement of species concentrations, temperatures, and velocity in the low density, high enthalpy flow through the arc-heated wind tunnel facility (ARMSEF) at NASA/JSC. Last summer several laser-induced radiation scattering methods were investigated and some preliminary measurements of the spectral distribution of radiation emitted by the arc-heated gas flow were made. Based upon those preliminary measurements and subsequent investigations, four laser-induced radiation scattering methods were selected for further detailed study, and preliminary design of a measurement system has been undertaken. Further measurements of the spectral distribution of radiation emitted from the arc-heated free stream and shock layer flows, using a redesigned measurement system, have been made for one axial position in the flow for a range of tunnel operating power levels. Further study of the literature for physical property data, theoretical models of processes, and applications of the diagnostic methods has been also carried out.

Prolonged weightlessness in space flight results in a slow progressive demineralization of bone accompanied by an increased calcium output in the urine resulting in negative calcium balances. This possibly irreversible bone loss may constitute a serious limiting factor to long duration manned space flight. A number of preventative measures have been suggested, i.e., exercise during flight, dietary calcium supplements, use of specific prophylactic drugs. In order to facilitate research in these areas it is necessary to develop appropriate ground-based animal models that simulate the human condition of osteoporsis. An appropriate animal model would permit bone density studies, calcium balance studies, biochemical analyses, ground-based simulation models of weightlessness (bed rest, restraint, immobilization) and the planning of inflight experiments. Several animal models have been proposed in the biomedical research literature, but have inherent deficiencies. The purpose of this project was to evaluate models in the literature and determine which of these most closely simulates the phenomenon of bone loss in humans with regard to growth, bone remodeling, structural, chemical and mineralization similarities to human. This was accomplished by a comprehensive computer assisted literature search and report. Three animal models were examined closely for their relative suitability: the albino rat, monkey, and Beagle.

HAMPTON UNIVERSITY/AMERICAN SOCIETY FOR ENGINEERING EDUCATION/NASA SUMMER FACULTY FELLOWSHIP PROGRAM 1986 Contractor Report, 2 Jun. - 8 Aug. 1986
John H. Spencer, comp. Sep. 1986 124 p
(Grant NGT-47-020-800)
(NASA-CR-178169; NAS 1.26:178169) Avail: NTIS HC A06/MF A01 CSCL 05I

Since 1964, the National Aeronautics and Space Administration (ASA) has supported a program of summer faculty fellowships r engineering and science educators. In a series of collaborations etween NASA research and development centers and nearby niversities, engineering faculty members spend 10 or 11 weeks orking with professional peers on research. The Summer Faculty rogram Committee of the American Society of Engineering ducation supervises the programs. Objectives: (1) To further the rofessional knowledge of qualified engineering and science faculty embers; (2) to stimulate and exchange ideas between participants nd NASA; (3) To enrich and refresh the research and teaching ctivities of participants' institutions; (4) to contribute to the esearch objectives of the NASA center. Program Description: College or university will be faculty members appointed as Research Fellows to spend 10 weeks in cooperative research and study at he NASA-Langley Research Center. The Fellow will devote pproximately 90 percent of the time to a research problem and he remaining time to a study program. The study program will onsist of lectures and seminars on topics of general interest or hat are directly relevant to the Fellows' research project. The ecturers and seminar leaders will be distinguished scientists and ngineers from NASA, education or industry. Author

THE DEPARTMENT OF DEFENSE STATEMENT ON SCIENCE IN THE MISSION AGENCIES AND FEDERAL LABORATORIES BEFORE THE TASK FORCE ON SCIENCE POLICY OF THE COMMITTEE ON SCIENCE AND TECHNOLOGY OF THE UNITED STATES HOUSE OF REPRESENTATIVES, 99TH CONGRESS, FIRST SESSION
Donald I. Carter 2 Oct. 1985 23 p
(AD-A166041) Avail: NTIS HC A02/MF A01 CSCL 14/2

The DoD is supporting a vigorous Science and Technology program which is designed to assure the continued technological superiority of our defense systems. The program is planned to meet our critical needs and exploit technological opportunities. From basic research through development, our program successfully integrates the efforts of the university, industrial and in-house laboratory performers. Through attentive management and careful coordination we are maximizing the return on our S&T investment. We see areas which require our concern and attention to maintain the momentum of our S&T program. We are addressing the critical areas of science and engineering education and laboratory modernization. GRA

THE DEPARTMENT OF DEFENSE STATEMENT ON SCIENCE IN THE SCIENCE AND TECHNOLOGY PROGRAM BEFORE THE SUBCOMMITTEE ON RESEARCH AND DEVELOPMENT OF THE COMMITTEE ON ARMED SERVICES OF THE UNITED STATES HOUSE OF REPRESENTATIVES, 99TH CONGRESS, SECOND SESSION
Ronald L. Kerber 12 Mar. 1986 46 p
(AD-A166042) Avail: NTIS HC A03/MF A01 CSCL 14/2

Topics discussed in the statement, promising opportunities are being explored in the non-medical aspects of biotechnology research to increase the efficiency and reduce costs in logistics functions, robotics and manufacturing sciences. The program is balanced to cover these and other revolutionary and evolutionary technologies essential for modernization of future forces. The Department is committed to ensuring that the Science and Technology (S&T) program is maintained at a viable level and that it will continue to be performed by a combination of industry, universities and DoD in-house laboratories. It is our view that this broad innovative base has served the country well and we will continue to depend upon it for the concepts, equipment and techniques needed for continued U.S. national security strength. A PRIMER FOR PROGRAM MANAGERS: EMBEDDED SOFTWARE ACQUISITION
Cecilia C. Albert Apr. 1986 40 p
(AD-A166731; AD-E801284; ACSC-86-0045) Avail: NTIS HC A03/MF A01 CSCL 15/5

Computer Software has become an ever increasing element in today's major defense system acquisitions. This study was written for the program manager with no software experience who is faced with the prospect of acquiring a major defense system which contains embedded software. It provides an overview of the software development process and a discussion of why things go wrong. Both the software development itself and the implications of the software on the system are considered. GRA

A GUIDE TO LEXICAL ACQUISITION IN THE JANUS SYSTEM
Susanna Cumming and Robert Albano Feb. 1986 82 p
(Contract MDA903-81-C-0335)
(AD-A166078; ISI/RR-85-162) Avail: NTIS HC A05/MF A01 CSCL 05/7

This document is a users' guide to LapItUp, the program which is used to add words to the Master Lexicon component of the JANUS natural language system, where syntactic, morphological, orthographic and semantic information particular to individual words and phrases is stored. The Master Lexicon is designed to serve all the lexical needs of the two grammars which form part of the JANUS system: RUS, an ATN parsing grammar, and Nigel, a systemic generation grammar. The user's guide contains a description of the organization of the Master Lexicon, instructions for adding words to the lexicon, and descriptions of each of the features that can be acquired using LapItUp. There are two important aspects to the Master Lexicon: the wordclass organization, which organizes the syntactic and morphological features used in lexical item specification, and the lexical item organization. In addition to a feature specification, the latter contains cross-indexing information or properties, semantic pointers, and record-keeping information. LapItup uses the wordclass hierarchy to guide the use through a series of choices, presented in the form of menus of features with accompanying descriptive text. In addition, LapItUp contains facilities for acquiring morphological information, properties, and the other kinds of auxiliary information. GRA

COST DATA MANAGEMENT SYSTEM, CDMS VERSION 2.2 Final Report
J. M. Weingart Dec. 1985 118 p
(Contract DE-AC04-76DR-00789)
(DE86-005064; SAND-85-8178) Avail: NTIS HC A06/MF A01

The Cost Data Management System (CDMS) is a cost data base computer program developed by Polydyne, Inc. and Associates for Sandia National Laboratories Livermore (SNLL). This program constitutes a unique and powerful tool for interactive development and documentation of complex cost data bases for power plants and other construction projects. This program is operational on the Digital Equipment Corporation's VAX computers operating under the latest version (4.1) of the VMS operating system. The original version of the CDMS (Version 1.1) has been extensively used by SNLL in the development, documentation, and analysis of the cost data base for Solar One. As a result of this work, a number of desirable enhancements to the CDMS were identified, and as a follow-on effort, Polydyne, Inc. has revised the original software. This report summarizes the extensive revisions and enhancements made to the CDMS, and discusses the features of the new program (CDMS Version 2.2). DOE

ISSUES IN DEVELOPING A DISTRIBUTED DATA ACQUISITION AND CONTROL SYSTEM
W. W. Manges 1986 4 p Presented at the 18th Southeast Symposium on System Theory, Knoxville, Tenn., 7 Apr. 1986
(Contract DE-AC05-84OT-21400)
(DE86-005491; K/AIS-5005; CONF-860479-2) Avail: NTIS HC A02/MF A01

This paper discusses issues and implications in the development of a minicomputer-based, distributed intelligence data acquisition and control system to support complex experimental facilities. Atomic Vapor Laser Isotope Separation is typical of programs that require the large-scale experimental facilities that have led to the design philosophy described in this paper. Incorporating computer systems in the instrumentation of ORNL's experimental facilities has increased productivity. However, several challenging issues must be addressed in developing such systems: (1) scientific as well as engineering goals; (2) ultimate goals with intermediate capabilities; (3) budget, scope, and schedule fluctuations; and (4) overlapping maintenance and development. The techniques and philosophy were used to provide the computer system hardware, software, architecture, and interfaces for the instrumentation and control system for large-scale developmental facilities which were developed for use at ORNL, but can be related to developing any large-scale experimental facility. EVALUATION OF A STIRLING ENGINE HEATER BYPASS WITH THE NASA LEWIS NODAL-ANALYSIS PERFORMANCE CODE Final Report
Timothy J. Sullivan May 1986 26 p
(Contracts NAS3-24105; DE-AI01-77CS-51040)
(NASA-CR-179460; DOE/NASA/4105-1; E-3113; NAS 1.26:179460) Avail: NTIS HC A03/MF A01 CSCL 10B

In support of the U.S. Department of Energy's Stirling Engine Highway Vehicle Systems program, the NASA Lewis Research Center investigated whether bypassing the P-40 Stirling engine heater during regenerative cooling would improve engine performance. The Lewis nodal-analysis Stirling engine computer simulation was used for this investigation. Results for the heater-bypass concept showed no significant improvement in the indicated thermal efficiency for the P-40 Stirling engine operating at full-power and part-power conditions. Optimizing the heater tube length produced a small increase in the indicated thermal efficiency with the heater-bypass concept. Author

AFOSR (AIR FORCE OFFICE OF SCIENTIFIC RESEARCH) TECHNICAL REPORT SUMMARIES Quarterly Report, Oct. - Dec. 1985
Barbara J. Wert Dec. 1985 267 p
(AD-A166142; AFOSR-TR-86-0093) Avail: NTIS HC A12/MF A01 CSCL 05/2

The Air Force Office of Scientific Research Technical Report Summaries are published quarterly in March, June, September, and December of each calendar year. They consist of a brief summary of each AFOSR technical report received in the Technical Information Division and submitted to the Defense Technical Information Center (DTIC) for that quarter. The summaries contain two indexes for easily locating the technical reports that may be of interest to the user. These are followed by abstracts of the reports. The Subject index has a Subject field title of reports and AD number (Accession Number). The Personal author index has a Primary author, Title of Report and AD Number. The purpose of this report is to inform Air Force Laboratories about the science that the Air Force Office of Scientific Research is supporting. Examples of topics are: Ion Bombardment, Lasers, Air Flow, and Radar Reflections. GRA

ELECTRIC VEHICLE TRACTION BATTERY MODULE MONITOR TEST RESULTS FOR WYLE AND PROPEL SYSTEMS
R. K. Buffett and T. W. Blickwedel May 1985 96 p
(DE86-900543; TVA/OP/EDT-85/21) Avail: NTIS HC A05/MF A01

The Wyle and Propel units for monitoring parameters of the traction battery of electric vehicles were tested by the Tennessee Valley Authority (TVA). The monitors are designed to indicate modules that are providing significantly less energy than other modules in the battery pack and which therefore need maintenance or need to be replaced. Testing was performed on the bench as a part of static load tests, and in vehicles. Both monitors sought to detect low energy capacity modules by measurement of pack current, evaluation of an equation, and comparison of the result with the actual voltage of each module. With the Wyle breadboard unit, the equation parameters were adjustable; whereas with the Propel unit, the equation parameters were not adjustable. Based on the results from static load tests, the Wyle monitor was deemed unacceptable due to numerous false alarms exhibited in its use. The Propel monitor detected low energy capacity modules and reliably indicated modules with a low electrolyte level. During static load tests, the pack voltage and current, as well as each module voltage, were recording using a digital computer, and results were compared with those displayed by the monitor under test. The monitors were tested in Volkswagen Electrotransporter electric vehicles for over one year. About 5989 miles were logged with the Wyle, and about 6015 miles were logged with the Propel DOE

A MAGNETOSPHERIC CRITICAL VELOCITY EXPERIMENT: PARTICLE RESULTS
R. B. Torbert and Patrick T. Newell *In its* Active Plasma Release Experiments 1986 29 p (For primary document see N86-31462 22-89)
Avail: NTIS HC A05/MF A01 CSCL 03A

In March of 1983, a barium injection sounding rocket experiment (The Star of Lima) was conducted to investigate Alfven's critical ionization velocity (CIV) hypothesis in space. Included in the instrumented payload was a particle detection experiment consisting of five retarding potential analyzers. Despite conditions that appeared to be optimal for the critical velocity effect, the particle data, in agreement with optical observations, indicates that a fractional ionization of only approximately .0005 was observed, indicating that the conditions required for the effect to occur are still not well understood. However many of the required phenomena associated with the CIV effect were observed; in particular a superthermal electron population was formed at the expense of ion drift kinetic energy in the presence of intense electrostatic waves near the lower hybrid frequency. The amount of ionization

produced is plausibly consistent with the observed electron flux, but could also be accounted for by residual solar UV at the injection point. It is shown based on the data set that one obvious explanation for the low ionization efficiency, namely that the ionizing superthermal electrons may rapidly escape along field lines, can be ruled out. Avail: NTIS HC A05/MF A01 CSCL 03A

High explosive shaped charge experiments King Crab, Bubble Machine I and II, designed to perturb the ambient plasma and magnetic fields were flown above 460 km on Taurus Tomahawk rockets from Poker Flat in March 1980, 1981, and 1982, respectively. The last two flights were a mother-daughter combination with the instrumentation section remaining attached to the rocket. The first experiment, King Crab, revealed the existence of a barium plasma depleted region or black hole of about 5 km diameter centered on the burst. All electric power to the instruments failed on the liftoff of the 1981 Bubble Machine I, but useful optical data were obtained. The third flight a year later produced useful data from all but the electron detector. Ground based optical and telluric field instrumentation recorded evidence for injection induced waves of about 5 second period. Delay times indicate a slow (175 to 385 km/sec) propagation from the burst point. Concerning locally produced electrostatic instabilities the wave measurements indicate that finite Larmor radius stabilization occurs for the weakly driven low (barium) density situation, but that shorter wavelength waves can occur early in the expansion event when the barium density is higher. The occultation of BD+8 degrees 471 by Ceres on 13 November 1984 was observed photoelectrically at 13 sites in Mexico, Florida, and the Caribbean. These observations indicate that Ceres is an oblate spheroid having an equatorial radius of 479.6 + or - 2.4 km and a polar radius of 453.4 + or - 4.5 km. The mean density of this minor planet is 2.7 gm/cubic cm + or - 5%, and its visual geometric albedo is 0.070. While the surface appears globally to be in hydrostatic equilibrium, firm evidence of real limb irregularities is seen in the data. Author

OBSERVATIONS OF FAR-INFRARED MOLECULAR EMISSION LINES FROM THE ORION MOLECULAR CLOUD Ph.D. Thesis
Paul Joseph Viscuso Aug. 1986 236 p
(Grant NsG-2347)
(NASA-CR-176876; NAS 1.26:176876; CRSR-849) Avail: NTIS HC A11/MF A01 CSCL 03A

The Orion Nebula was the subject of intensive study for over one hundred years. Recently, several far infrared transitions among the low-lying levels of OH were observed toward IRc2. The OH is thought to be abundant, and plays an important role in the chemical evolution of shock and post-shock regions. The OH emission serves as a sensitive probe of the temperature and density for the shock-processed gas. A rigorous treatment of the radiative transfer of these measured transitions was performed using the escape probability formalism. From this analysis, the temperature of the OH-emitting region was determined to be on the order of 40K. This suggests that the gas is part of the post-shock gas that has cooled sufficiently, most likely by way of radiative cooling by CO. Such cooling from shock temperatures of several degrees can be accomplished in 100 years. A molecular hydrogen density of 3 million/cubic cm and an OH column density of 1.0 x 10 to the 17th /sq cm is found. The beam filling factor is determined to be 36%. Author

ASTROGEODETIC DEFLECTIONS OF THE VERTICAL FROM STARS OBSERVATIONS WITH THE DANJON ASTROLABE, OR SIMILAR INSTRUMENTS
Angel A. Baldini 1985 9 p
(AD-A166886; ETL-R-079) Avail: NTIS HC A02/MF A01 CSCL 03/1

This report is a sequel to the report Basic Formulae for Determining the Computation of the Deflection of the Vertical from Astronomic Star Observations (AD-A154 912). It addresses a new observational method that allows one to compute the astronomic zenith distance of the astrolabe instrument as a function of the time when the stars cross the almucantar of the astrolabe and their right ascension and declination, therefore independent of the astronomic station coordinates. The xi and eta deflection of the vertical components are obtained from an equation that relates the astronomic and geodetic zenith distance. The last is derived for each star as a function of the U. T. 1 time and geodetic latitude and longitude. GRA

Preliminary description and classifications of meteorites that were completed since publication of the February issue are contained. Most large (greater than 150 g) specimens (regardless of petrologic type) and all pebble sized (less than 150 g) specimens of special petrologic type are represented by separate descriptions. However, specimens of nonspecial petrologic type are listed only as single line entries. For convenience, new specimens are also recast by petrologic type. Each macroscopic description summarizes features that were visible to the eye at the time the meteorite was first examined. Classification is based on microscopic petrography and resonnaissance-level electron-probe microanalysis. The pairing list was updated. B.G.

EX-111 THERMAL EMISSION FROM HOT WHITE DWARFS: THE SUGGESTED He ABUNDANCE-TEMPERATURE CORRELATION. EX-112: THE UNIQUE EMISSION LINE WHITE DWARF STAR GD 356 Semiannnual Status Report, 1 Dec. 1985 - 1 Jun. 1986
Harry L. Shipman 27 Aug. 1986 110 p
(Grant NAG8-564)
(NASA-CR-176866; NAS 1.26:176866) Avail: NTIS HC A06/MF A01 CSCL 03B

Progress in the EXOSAT data analysis program is reported. EXOSAT observations for four white dwarfs (WD1031-115, WD0004+330, WD1615-154, and WD0109-264) were obtained. Counting rates were unexpectedly low, indicating that these objects have a substantial amount of x-ray absorbing matter in their photosheres. In addition, soft x-ray pulsations characterized by a 9.25 minute cycle were discovered in the DA white dwarf V471 Tauri. A residual x-ray flux from the K dwarf companion can be seen during the white dwarf eclipse at orbital phase 0.0. Pronounced dips in the soft x-ray light curve occur at orbital phases 0.15, 0.18, and 0.85. The dips may be correlated with the triangular Lagrangian points of the binary orbit. Smaller dips at phases near the eclipse may be associated with cool loops in the K star corona. Data for the white dwarf H1504+65 was also analyzed. This object is particularly unusual in that its photoshere is devoid of hydrogen and helium. Finally, existing data on the white dwarf Sirius B were analyzed to see what constraints from other data can be placed on the properties of this star. Interrelationships between radius, rotational velocity, and effective temperature were derived. M.G.

QUASAR-GALAXY ASSOCIATIONS WITH DISCORDANT REDSHIFTS AS A TOPOLOGICAL EFFECT, PART 1
H. V. Fagundes 1984 38 p
(DE86-700669; IFT-P-10/84-Pt-1) Avail: NTIS (US Sales Only) HC A03/MF A01

A previously advanced conjecture is developed, that may eventually solve the quasar redshift controversy in a constructive fashion. The claimed galaxy-quasar and other associations with discordant redshifts are recognized as such, but on the level of a little known possibility: that each associated group is the multiple image of a single source, produced by rays emitted along paths of different lengths. This is allowed by the multiply connected topologies of Friedman's closed models of negative spatial curvature. The distances indicated by the cosmological interpretation of the redshifts are now seen as image distances, only one of them being the source's separation from us. In this first part of a two-paper sequence the problem is dealt in the relatively simple context of a hyperbolic 2-dimensional space. This is physically unrealistic, but leads to a few qualitative observational suggestions and it permits the introduction of the needed mathematical machinery, centered on the tesselations of hyperbolic spaces, in a visualizable way. Thus the reader will be prepared for the less intuitive 3-dimensional research, which is outlined in the last section and will be elaborated in Part II. Some related theoretical topics are discussed along the way. They include reinterpretations of the cosmic isotropy and of the homogeneity principle, and hints of an argumentation for the assumes closure of space. DOE

HOMOCLINIC PHENOMENA IN THE GRAVITATIONAL COLLAPSE
J. Koiller, J. R. T. de MelloNeto, and I. D. Soares 1984 15 p Previously announced in AIAA as A85-45751 Prepared in cooperation with Rio de Janeiro Univ., Brazil
(DE86-700671; CBPF-NF-039/84) Avail: (US Sales Only) HC A02/MF A01

A class of Bianchi IX cosmological models is shown to have chaotic gravitational collapse, due to Poincare's homoclinic phenomena. Such models can be programmed so that for any given positive integer N (N=infinity included) the universe undergoes N non-periodic oscillations (each oscillation requiring a long time) before collapsing. For N=infinity the universe undergoes periodic oscillations. DOE

RELATIVISTIC COSMOLOGIES WITH CLOSED, LOCALLY HOMOGENEOUS SPACE SECTIONS
H. V. Fagundes 1985 12 p Previously announced in AIAA as A85-28135
(DE86-700673; IFT-P-02/85) Avail: NTIS (US Sales Only) HC A02/MF A01

The homogeneous Bianchi and Kantowski-Sachs metrics of relativistic cosmology are investigated through their correspondence with recent geometrical results of Thurston. These allow a partial classification of the topologies for closed, locally homogeneous spaces according to Thurston's eight geometric types. Besides, which of the Bianchi-Kantowski-Sachs metrics can be imposed on closed space sections of cosmological models are learned. This is seen as a progress toward implementation of a postulate of the closure of space for both classical and quantum gravity. DOE

NOVA OUTBURST MODELING AND ITS APPLICATION TO THE RECURRENT NOVA PHENOMENON
W. M. Sparks, S. Starrfield, and J. Truran Dec. 1985 13 p Presented at the Conference on RS Ophiuchi and the Recurrent Nova Phenomenon, Manchester, England, 1 Dec. 1985 Prepared in cooperation with Illinois Univ., Urbana
(Contract W-7405-eng-36)
(DE86-008715; LA-UR-86-806; CONF-851272-1) Avail: NTIS HC A02/MF A01

The thermonuclear runaway (TNR) theory for the cause of the common novae is reviewed. Numerical simulations of this theory were performed using an implicit hydrodynamic Lagrangian computer code. Relevant physical phenomena are explained with the simpler envelope in place calculations. Next the models that include accretion are discussed. The calculations agree very well with observations of common novae. The observational differences between common novae and recurrent novae are examined. We propose input parameters to the TNR model which can give the outburst characteristics of RS Ophiuchi and discuss the implications. This review is concluded with a brief discussion of two current topics in novae research: shear mixing on the white dwarf and Neon novae. DOE

STUDIES OF THE AURORALLY-INDUCED ULTRAVIOLET EMISSIONS ON THE NIGHTSIDE OF VENUS Report, 1 Jan. 1985 - 31 Mar. 1986
J. L. Fox 31 Mar. 1986 23 p
(Grant NAG2-329)
(NASA-CR-177004; NAS 1.26:177004) Avail: NTIS HC A02/MF A01 CSCL 03B

The effect of a monoenergetic flux of electrons on a model atmosphere of the nightside thermosphere of Venus was examined. The neutral model chosen is that of Hedin for high solar activity and 165 degrees solar zenith angle. The model is based on measurements made by the Pioneer Venus Orbiter Neutral Mass Spectrometer. Four species were included in the calculation: CO_2, O, CO, and N_2. The numerical method that was chosen for energy deposition of the primary electrons is the continuous slowing down approximation. The secondary electron distribution was computed using the empirically determined shape of the differential cross section. B.G.

A set of high signal-to-noise spectra of the 18 cm OH emission from the comet P/Halley was obtained. During the course of the Halley OH campaign, high signal-to-noise spectra were also obtained on the comets P/Giacobini-Zinner, C/Thiele, and C/Hartley-Good. The HCN observations of Comet Halley were performed during a total of 56 individual observing sessions between 18 November 1985 and 11 May 1986. These observations represent the largest monitoring program of HCN emission from any comet, and moreover, represent the first time that a cometary parent molecule was so extensively observed. In addition to offering a direct means to monitor the production of a parent molecule from the nucleus, these data also provide fundamental information about the kinematics of parent molecules in the coma. Finally, in addition to monitoring HCN from the comet, attempts were also made to detect other molecues via millimeter-wave spectroscopy. Future plans are descussed. B.G.

SUPERPOSED EPOCH ANALYSIS OF MAGNETOSPHERIC SUBSTORMS USING SOLAR WIND, AURORAL ZONE AND GEOSTATIONARY ORBIT DATA SETS
L. F. Bargatze, D. N. Baker, and R. L. McPherron 1985 25 p Presented at the Chapman Conference on Magnetotail Physics, Laurel, Md., 28 Oct. 1985 Prepared in cooperation with California Univ., Los Angeles
(Contract W-7405-eng-36)
(DE86-006036; LA-UR-86-344; CONF-8510254-2) Avail: NTIS HC A02/MF A01

A primary goal in solar wind-magnetosphere studies is to understand how and what role the solar wind plays in controlling the temporal sequence of events during substorms at many widely separated regions within the magnetosphere. Here, the average, correlated behavior of definitve solar wind, auroral zone, and geostationary orbit parameters during isolated substorms is examined. High time resolution (1 min) measurements of two solar wind quantities: B/sub z/ and VB/sub s/, two auroral electrojet indices: AE and AI, and three paramenters which define the energetic (30 to 300keV) electron distribution at geostationary orbit from 13 events are analyzed by using the superposed epoch technique. The zero epoch time used to organize the analyses were defined by the time of energetic electron injection at geostationary orbit. The average variations of the auroral zone and geostationary orbit parameters in relation to the solar wind are discussed in context of the three phase (growth, expansion, and recovery) model of substorms. Notably, we find an approximate 6 minute time lag of expansion phase onset at geostationary orbit relative to time of expansion phase onset in the auroral zone. A possible explanation for this time lag is briefly discussed. DOE

LARGE-SCALE STRUCTURE AND DYNAMICS OF SOLAR ACTIVE REGIONS OBSERVED IN THE FAR ULTRAVIOLET Ph.D. Thesis - Colorado Univ.
Andrew James Klimchuk 1986 219 p
(Grant NSF ATM-82-17015)
(PB86-188802; NCAR/CT-96) Avail: NTIS HC A10/MF A01 CSCL 03B

High resolution Dopplergrams in CIV (1548) are examined for the purpose of understanding the large-scale dynamics of solar active regions and the closely related problem of magnetic structure. The Dopplergrams are compared with photospheric magnetograms and H(alpha) filtergrams in order to determine the relationship of the flows to the overall magnetic field topology. These observations sample three different heights in the atmosphere and can potentially be used to map the field from the photosphere up through the transition region. Vector properties of the flow and field are inferred from center to limb variations in the measured Doppler shift and longitudinal field component. GRA

The evidence that active galactic nuclei produce collimated plasma jets is summarised. The strongest radio galaxies are probably energised by relativistic plasma jets generated by spinning black holes interacting with magnetic fields attached to infalling matter. Such objects can produce e(+)-e(-) plasma, and may be relevant to the acceleration of the highest-energy cosmic ray primaries. Small-scale counterparts of the jet phenomenon within our own galaxy are briefly reviewed. Author

Components of the active extragalactic universe are examined to discover what extragalactic objects exhibit physical processes of the same kind as those thought to be important within the galaxy. Radio galaxies; quasars; bulk ejection from galactic objects such as novae supernovae, and other galactic nuclei; the red shifts of quasars; and the possibility of non-cosmological red shifts are among the topics discussed. It is concluded that the highest energy cosmic rays may have an extragalactic or extragalactic origin. R.J.F.

A survey is given of gamma ray astronomy topics presented at the Cosmic Ray Conference. The major conclusions at the Cosmic Ray Conference in the field of gamma ray astronomy are given. (1) MeV-emission of gamma-ray bursts is a common feature. Variations in duration and energy spectra from burst to burst may explain the discrepancy between the measured log N - log S dependence and the observed isotropy of bursts. (2) The gamma-ray line at 1.809 MeV from Al(26) is the first detected line from a radioactive nucleosynthesis product. In order to understand its origin it will be necessary to measure its longitude distribution in the Milky Way. (3) The indications of a gamma-ray excess found from the direction of Loop I is consistent with the picture that the bulk of cosmic rays below 100 GeV is produced in galactic supernova remnants. (4) The interpretation of the large scale distribution of gamma rays in the Milky Way is controversial. At present an extragalactic origin of the cosmic ray nuclei in the GeV-range cannot be excluded from the gamma ray data. (5) The detection of MeV-emission from Cen A is a promising step towards the interesting field of extragalactic gamma ray astronomy. Author

A review is given of selected papers on the theory of cosmic ray (CR) propagation and acceleration. The high isotropy and a comparatively large age of galactic CR are explained by the effective interaction of relativistic particles with random and regular electromagnetic fields in interstellar medium. The kinetic theory of CR propagation in the Galaxy is formulated similarly to the elaborate theory of CR propagation in heliosphere. The substantial difference between these theories is explained by the necessity to take into account in some cases the collective effects due to a rather high density of relativisitc particles. In particular, the kinetic CR stream instability and the hydrodynamic Parker instability is studied. The interaction of relativistic particles with an ensemble of given weak random magnetic fields is calculated by perturbation theory. The theory of CR transfer is considered to be basically completed for this case. The main problem consists in poor information about the structure of the regular and the random galactic magnetic fields. An account is given of CR transfer in a turbulent medium. Author

The purpose is to provide an overview of the contributions presented in sessions SH3, SH1.5, SH4.6 and SH4.7 of the 19th International Cosmic Ray Conference. These contributed papers indicate that steady progress continues to be made in both the observational and the theoretical aspects of the transport and acceleration of energetic charged particles in the heliosphere. Studies of solar and interplanetary particles have placed emphasis on particle directional distributions in relation to pitch-angle scattering and magnetic focusing, on the rigidity and spatial dependence of the mean free path, and on new propagation regimes in the inner and outer heliosphere. Coronal propagation appears in need of correlative multi-spacecraft studies in association with detailed observation of the flare process and coronal magnetic structures. Interplanetary acceleration has now gone into a consolidation phase, with theories being worked out in detail and checked against observation. Author

FORBUSH DECREASES GEOMAGNETIC AND ATMOSPHERIC EFFECTS COSMOGENIC NUCLIDES
Erwin O. Flueckiger *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 21 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

An overview and synthesis is given of recent developments that have occurred in the areas of Forbush decreases, geomagnetic and atmospheric effects, and cosmogenic nuclides. Experimental evidence has been found for substantial differences in the effects of the various types of interplanetary perturbations on cosmic rays, and for a dependence of these effects on the three-dimensional configuration of the interplanetary medium. In order to fully understand and to be able to simulate the solar cosmic ray particle access to the polar regions of the earth we need accurate models of the magnetospheric magnetic field. These models must include all major magnetospheric current systems (in particular the field aligned currents), and they should represent magnetically quiet time periods as well as different levels of geomagnetic activity. In the evolution of magnetospheric magnetic field models, cosmic ray and magnetospheric physicists should work closely together since cosmic ray measurements are a powerful additional tool in the study of the perturbed magnetosphere. In the field of cosmogenic nuclides, finally, exciting new results and developments follow in rapid succession. Thanks to new techniques and new isotopes the analysis of cosmic ray history has entered into a new dimension. Author

EMULSION CHAMBER OBSERVATIONS AND INTERPRETATION (HE 3)
M. Shibata *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 19 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Experimental results from Emulsion Chamber (EC) experiments at mountain altitudes or at higher levels using flying carriers are examined. The physical interest in this field is concentrated on the strong interaction at the very high energy region exceeding the accelerator energy, also on the primary cosmic ray intensity and its chemical composition. Those experi-

ments which observed cosmic ray secondaries gave information on high energy interaction characteristics through the analyses of secondary spectra, gamma-hadron families and C-jets (direct observation of the particle production occuring at the carbon target). Problems of scaling violation in fragmentation region, interaction cross section, transverse momentum of produced secondaries, and some peculiar features of exotic events are discussed. B.G.

EXTENSIVE AIR SHOWERS (HE-4)
R. W. Clay *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 26 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Ultra high energy (UHE) gamma ray astronomy is an exciting area which has added a new sense of purpose to ground based array work. There is much to be done before UHE gamma ray showers can be understood properly and it is important to remain conservative with claims while the properties of such showers are still not clear. The muon content is only one of the properties that needs to be clarified. It remains to be seen how well progress occurs on the second order problem of detailed interaction parameters once the gross features are clarified. The shower disk thickness has become an area of intense study with interest in Linsley's technique for measuremnts of giant showers and in the study of structure near the core for improving fast timing and studying delayed subshowers. Perhaps the most significant area of promise for the future is individual shower develpments with Cerenkov and, particularly, air fluorescence techniques. The importance and potential of having relatively complete information on a complete set of individual showers can hardly be overestimated. A complete understanding of the observation process is needed to determine whether or not the recorded data set is complete at a given energy, apparent core distance, and zenith angle. B.G.

GROUND-BASED VERY HIGH ENERGY GAMMA RAY ASTRONOMY: OBSERVATIONAL HIGHLIGHTS
K. E. Turver *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 8 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

It is now more than 20 years since the first ground based gamma ray experiments involving atmospheric Cerenkov radiation were undertaken. The present highlights in observational ground-based very high energy (VHE) gamma ray astronomy and the optimism about an interesting future for the field follow progress in these areas: (1) the detection at increased levels of confidence of an enlarged number of sources so that at present claims were made for the detection, at the 4 to 5 sd level of significance, of 8 point sources; (2) the replication of the claimed detections with, for the first time, confirmation of the nature and detail of the emission; and (3) the extension of gamma ray astronomy to the ultra high energy (UHE) domain. The pattern, if any, to emerge from the list of sources claimed so far is that X-ray binary sources appear to be copious emitters of gamma rays over at least 4 decades of energy. These X-ray sources which behave as VHE and UHE gamma ray emitters are examined. Author

OBSERVATIONAL PROPERTIES OF COSMIC GAMMA-RAY BURSTS
E. P. Mazets *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 16 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

A brief overview of the major observational results obtained in gamma-ray burst studies is presented. Also discussed is to what extent the thermonuclear model, which appears at present to be the most plausible, can account for the observed properties of the bursts. The investigation of gamma-ray bursts should cover observations of the time histories of events, energy spectra, and their variablility, source localization, and inspection of the localization regions during the active and quiescent phases of the source in other wavelengths, as well as, evaluation of the statistical distributions of the data obtained. OBSERVATIONS OF SHOCK ACCELERATION PROCESSES IN THE SOLAR WIND
M. Scholer *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Misacellaneous, Volume 9 Feb. 1986 10 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Substantial evidence was accumulated over more than two decades that ion acceleration occurs at all collisionless shocks sampled directly in the solar system. The various shock waves in the heliosphere and the associated energetic particle phenomena are shown schematically. Three shocks have attracted considerable attention in recent years: corotating shocks due to the interaction of fast and slow solar wind streams during solar minimum, travelling interplanetary shocks due to coronal mass ejections, and planetary bow shocks. The signatures of these shocks and of their energetic particles are briefly reviewed. The most prominent theoretical models for shock acceleration are also reviewed. Recent observations at the earth's bow shock and at quasi-parallel interplanetary shocks are discussed in detail. Author

IS THE SIGNAL FROM CYG X-3, AS RECORDED IN SOME UNDERGROUND EXPERIMENTS, REAL?
A. E. Chudakov *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 4 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Most of the excitement concerning the underground detection of signals from Cyg X-3 comes not from astrophysical grounds, but from the contradiction with surface experimental data. Believing in the Cyg X-3 signal underground and also that the main processes of muon production are well knownm the conclusion was drawn that the signal in EAS Cherenkov or counter experiments could be remarkably high, which is not the case. Possible solutions to this discrepancy are discussed. B.G.

EVIDENCE FROM THE SOUDAN 1 EXPERIMENT FOR UNDERGROUND MUONS ASSOCIATED WITH CYGNUS X-3
D. S. E. Ayres *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 10 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The Soudan 1 experiment has yielded evidence for an average underground muon flux of approximately 7 x 10 to the minus 11th power/sq cm/s which points back to the X-ray binary Cygnus X-3, and which exhibits the 4.8 h periodicity observed for other radiation from this source. Underground muon events which seem to be associated with Cygnus X-3 also show evidence for longer time variability of the flux. Such underground muons cannot be explained by any conventional models of the propagation and interaction of cosmic rays. Author

OBSERVATION OF MUONS FROM CYGNUS X-3 IN THE NUSEX EXPERIMENT
B. DEttorre Piazzoli *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 10 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Ground based observations by means of Cerenkov light detectors and air shower arrays have established that Cyngus X-3 is a powerful source of high energy particles. The detection of a 10 to the 15th power eV signal was first reported by the Kiel experiment. Air showers with large age parameter were accepted in order to select those generated by primary gamma rays. At variance with the expectation, the muon density associated with these events was found to be surprisingly high. This puzzling result stimulated a temporal analysis of the muons recorded in Nucleon Stability Experiment (NUSEX) coming from the region around the source. A positive signal was found suggesting the presentation of this result. The analysis of the data recorded during the 2.4 years of effective working time is presented with a fine tuning of the period and the energy spectrum of the muons from the Cygnus X-3 direction derived assuming consistency between NUSEX and SOUDAN results. Berger (Technische Hochschule, Aachen (West Germany).), R. W. Bland (Ecole Polytechnique, Palaiseau (France).), G. Chardin, H. J. Daum (Gesamthochschule, Wuppertal (West Germany).), B. Degrange (Ecole Polytechnique, Palaiseau (France).), S. Demski (Gesamthochschule, Wuppertal (West Germany).) et al *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 9 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Periodic signals from Cygnus X-3 in the ultra high energy range were recently reported by air shower arrays and attributed to gamma rays. Although gamma rays are expected to produce muon-poor showers, the preceding observations have stimulated similar studies based on underground muons. Two groups have claimed a significant underground signal coming from Cygnus X-3. The results are, however, extremely difficult to explain in the present framework of particle physics, and clearly need confirmation. The preliminary results obtained from the Frejus underground detector during its first 16 months of operation (March 1984 to June 1985) are presented. Author

THE COSMIC RAY SPECTRUM ABOVE 10(19) EV AT VOLCANO RANCH AND HAVERAH PARK
John Linsley *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 12 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The cosmic ray energy per particle spectrum above 10 to the 19th power eV is measured the same way that energy spectra are measured at much lower energies, by counting all of the particles in a specified energy range that are incident per unit time with trajectories within specified geometrical limits. Difficulties with background or poorly known detection efficiency are markedly less than in some other cosmic ray measurements. The fraction of primary energy given to muons, neutrinos, and slow hadrons is less than 10% in this region, so the primary energy equals the track length integral of the secondary electrons with only a small correction for the energy given to other kinds of particles. Results from Volcano Ranch and Haverah Park are compared with results from the Yakutsk experiment. Author

THE COSMIC RAY SPECTRUM ABOVE 10(17) eV
M. M. Winn, J. Ulrichs, L. Horton, C. B. A. McCusker, and L. S. Peak *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 9 p Sponsored in part by AFOSR (For primary document see

N86-31483 22-93
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The final analysis of the data obtained by the Sydney University Giant Airshower Recorder (SUGAR) is presented. The data has been reanalysed to take into account the effects of afterpulsing in the photomultiplier tubes. Event data was used to produce a spectrum of equivalent vertical muon number and from this a model dependent primary energy spectrum was obtained. These spectra show good evidence for the Ankle: a flattening at 10(19) eV. There is no sign of the cut-off which would be expected from the effects of the universal black body radiation. Author

THE HOMESTAKE SURFACE-UNDERGROUND SCINTILLATORS: INITIAL RESULTS
M. L. Cherry, S. Corbato, T. Daily, E. J. Fenyves (Texas Univ., Dallas.), D. Kieda, K. Lande, and C. K. Lee *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 4 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The first 70 tons of the 140-ton Large Area Scintillation Detector (LASD) have been operating since Jan. 1985 at a depth of 4850 ft. (4200 m.w.e.) in the Homestake Gold Mine, Lead, S.D. A total of 4 x 10(4) high-energy muons (E sub mu is approx. 2.7 TeV at the surface) have been detected. The remainder of the detector is scheduled to be in operation by the Fall of 1985. In addition, a surface air shower array is under construction. The first 27 surface counters, spaced out over an area of 270' x 500', began running in June, 1985. The LASD performance, the potential of the combined shower array and underground muon experiment for detecting point sources, and the initial results of a search for periodic emission from Cygnus X-3 are discussed. M.G.

An observation of the abundances of cosmic-ray lead and platinum-group nuclei using data from the HEAO-3 Heavy Nuclei Experiment (HNE) which consisted of ion chambers mounted on both sides of a plastic Cherenkov counter (Binns et al., 1981) is reported. Further analysis with more stringent selections, inclusion of additional data, and a calibration at the LBL Bevalac, have allowed the determination of the abundance ratio of lead and the platinum group of elements for particles that had a cutoff rigidity R(c) > 5 GV. The observed ratio for Pb/Pt is distinctly lower than that predicted by any of the standard models for cosmic ray sources. It is possible that the difference is not an indication that the cosmic ray source composition is greatly different from that of the solar system, but rather that there is less Pb in the solar system and in the r-process than is assumed in the standard models. Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The problems found in an attempt to adapt an automated scanner of astronomical plates, the Minnesota Automated Dual Plate Scanner (APS), to locating and measuring the etch pits produced by ionizing particles in plastic nuclear track detectors (CR-39) are described. A visual study of these pits was made to determine the errors introduced in determining positions and shapes. Measurements made under a low power microscope were compared with those from the APS. COSMIC RAY ANISOTROPIES AT HIGH ENERGIES
N. J. Martinic, A. Alarcon, and F. Teran *In* NASA. Goddard Space Flight Center Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 4 p (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The directional anisotropies of the energetic cosmic ray gas due to the relative motion between the observers frame and the one where the relativistic gas can be assumed isotropic is analyzed. The radiation fluxes formula in the former frame must follow as the Lorentz invariance of dp/E, where p, E are the 4-vector momentum-energy components; dp is the 3-volume element in the momentum space. The anisotropic flux shows in such a case an amplitude, in a rotating earth, smaller than the experimental measurements from say, EAS-arrays for primary particle energies larger than 1.E(14) eV. Further, it is shown that two consecutive Lorentz transformations among three inertial frames exhibit the

violation of dp/E invariance between the first and the third systems of reference, due to the Wigner rotation. A discussion of this result in the context of the experimental anisotropic fluxes and its current interpretation is given. Author

Much efforts have been expended to observe the spectrum of electrons in the high energy region with large area emulsion chambers exposed at balloon altitudes, and now 15 electrons beyond 1 TeV have been observed. The observed integral flux at 1 TeV is (3.24 + or - 0.87)x10(-5)/sq m sec sr. The statistics of the data around a few hundred GeV are also improving by using new shower detecting films of high sensitivity. The astrophysical significance of the observed spectrum are discussed for the propagation of electrons based on the leaky box and the nested leaky box model. Author

Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

The radio synchrotron emission from relativistic electrons in shell supernova remnants (SNRs) provides a unique opportunity to probe the energy distribution of energetic electrons at their acceleration site (SNR shock fronts). This information provides insight into the acceleration mechanism(s). The implications of these observations for the diffusive (first-order Fermi) acceleration of electrons at the SNR shock fronts are discussed. M.G.

ELEMENTAL ABUNDANCES IN COROTATING EVENTS
T. T. vonRosenvinge and R. E. McGuire *In its* Nineteenth International Cosmic Ray Conference. Conference Papers: Invited Rapporteur, Highlight, Miscellaneous, Volume 9 Feb. 1986 2 p Prepared in cooperation with Maryland Univ., College Park (For primary document see N86-31483 22-93)
Avail: NTIS HC as boxed set only $200/MF A01 per volume or E99 per entire set CSCL 03B

Large, persistent solar-wind streams in 1973 and 1974 produced corotating interaction regions which accelerated particles to energies of a few MeV/nucleon. The proton to helium ratio (H/He) reported was remarkably constant at a value (22 + or - 5) equal to that in the solar wind (32 + or - 3), suggesting that particles were being accelerated directly out of the solar wind. Preliminary results from a similar study approximately 11 years (i.e., one solar cycle) later are reported. Corotating events were identified by surveying the solar wind data, energetic particle time-histories and anisotropies. This data was all obtained from the ISEE-3/ICE spacecraft. These events also show H/He ratios similar to that in the solar wind. In addition, other corotating events were examined at times when solar flare events could have injected particles into the corresponding corotating interaction regions. It was found that in these cases there is evidence for H/He ratios which are significantly different from that of the solar wind but which are consistent with the range of values found in solar flare events. M.G.

GRADIENTS AND ANISOTROPIES OF HIGH ENERGY COSMIC RAYS IN THE OUTER HELIOSPHERE
Walker Fillius, E. C. Roelof (Johns Hopkins Univ., Laurel, Md.), Edward J. Smith (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), David Wood, and Wing-Huen Ip (Max-Planck-Inst. fuer Aeronomie, Katlenburg-Lindau (West Germany).) 1985 4 p (Grant NAG2153)
(NASA-CR-176944; NAS 1.26:176944) Avail: NTIS HC A02/MF A01 CSCL 03B

Two cosmic rays which pass through the same point going in opposite directions will, in the absence of scattering and inhomogeneities in the magnetic field, trace helices about adjacent flux tubes, whose centerlines are separated by one gyrodiameter. A directional anisotropy at the point suggests a difference in the number of cosmic rays loading the two flux tubes; that is, a density gradient over the baseline of a gyrodiameter. Previous studies at lower energies have shown that the cosmic ray density gradients vary in time and space. It is suggested that the radial gradient associated with solar cycle modulation is supported largely by narrow barriers which encircle the sun and propagate outward with the solar wind. If so, the anisotropy is a desirable way to detect spatial gradients, because it can be associated with the local solar wind and magnetic field conditions. Anisotropic measurements made by Cerenkov detectors on Pioneers 10 and 11 were studied. It was found that local anisotropy varies greatly, but that the long term average is consistent with the global radial gradient measured between two spacecraft over a baseline of many AU. Author

This publication is a chronology of events during the year 1977 in the fields of aeronautical and space research, development, activity, and policy. It includes appendixes, an index, and illustrations. Chronological entries list sources for further inquiry. Author

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7053).

[AD-A166967] N86-30890
AIRCRAFT CONFIGURATIONS
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] N86-30695
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30898
AIRCRAFT CONSTRUCTION MATERIALS
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
AIRCRAFT CONTROL
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression N86-30650
Tailoring methodology for aeroelastic stability and lateral control enhancement N86-30657
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31285
AIRCRAFT DESIGN
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory N86-30651
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing N86-30654
Tailoring methodology for aeroelastic stability and lateral control enhancement N86-30657
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] N86-30719
NASA and general aviation
[NASA-SP-485] N86-30720
AIRCRAFT DETECTION
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30831
AIRCRAFT ENGINES
Dynamic analysis of structures with flexible rotors – aircraft engines N86-30664
NASA and general aviation
[NASA-SP-485] N86-30720
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] N86-30732

Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838

AIRCRAFT EQUIPMENT
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] N86-30711
Airborne navigation remote map reader evaluation
[AD-A166976] N86-30729

AIRCRAFT FUELS
Liquid hydrogen fueled passenger aircraft
[AD-A166229] N86-30724
High accuracy fuel flowmeter
[NASA-CR-174869] N86-31030

AIRCRAFT HAZARDS
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30890

AIRCRAFT INDUSTRY
An example of integrated logistic support applied also to production testing --- aircraft industry N86-30898

AIRCRAFT LANDING
The integrated manual and automatic control of complex flight systems
[NASA-CR-176940] N86-30737

AIRCRAFT MANEUVERS
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
Representation for closed form significance testing in VL1 N86-31219

AIRCRAFT MODELS
Rapid vibration mode analysis of aircraft with external stores N86-30679

AIRCRAFT NOISE
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31335
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] N86-31337
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] N86-31339

AIRCRAFT PERFORMANCE
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722

AIRCRAFT RELIABILITY
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] N86-30700
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704

AIRCRAFT SAFETY
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] N86-30707
Aviation safety: Serious problems concerning the air traffic control work force
[PB86-194586] N86-30716
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] N86-30883

AIRCRAFT STABILITY
Tailoring methodology for aeroelastic stability and lateral control enhancement N86-30657
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662

AIRCRAFT STRUCTURES
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft N86-30640
Static aeroelastic analysis using aircraft vibration modes N86-30641
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods N86-30646
Structural optimization programs and methods --- aircraft weight reduction N86-30655
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662
Structural dynamic aspects of rotor nodal isolation --- helicopters N86-30665
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing N86-30669
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures N86-30781
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] N86-31339

AIRCRAFT SURVIVABILITY
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] N86-30883

AIRCRAFT TIRES
Simulation of aircraft taxi testing on the AGILE shaker test facility N86-30663

AIRCRAFT WAKES
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] N86-31341

AIRFOILS
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30701
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] N86-30996

AIRFRAMES
Variation of anisotropic behavior in structural optimization --- aircraft composite structures N86-30656
Crashworthiness of airframes
[AGARD-R-737] N86-30709
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726

AIRGLOW
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Infrared airglow clutter
[AD-A166994] N86-31171

AIRPORT PLANNING
Airport capacity enhancement plan
[AD-A166686] N86-30742

AIRPORT TOWERS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714

AIRPORTS
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] N86-30715
Airport capacity enhancement plan
[AD-A166686] N86-30742

ALBEDO
The size, shape, density, and albedo of Ceres from its occultation of BD+8 deg 471
[NASA-CR-177089] N86-31465

ALGAE
Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207

ALGORITHMS
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929
Wild bearing analysis. EAAF (Extended Algorithm Analysis Family)
[NASA-CR-176985] N86-30930
Numerical experiments with CONCHAS-SPRAY: installation of the FLOE algorithm
[DE86-007575] N86-31018
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31068
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
Space power using solar photovoltaic panels: Costs and limitations
[DE86-008953] N86-31105
Representation for closed form significance testing in VL1 N86-31219
Summary of research in applied mathematics, numerical analysis, and computer sciences
[NASA-CR-178119] N86-31227
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243
Solving multi-state variable dynamic programming models using vector processing
[AD-A166763] N86-31244
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Hypercube algorithms and implementations
[DE86-007439] N86-31253
Fully parallel algorithm for the symmetric eigenvalue problem
[DE86-007553] N86-31254
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700605] N86-31287
Cellular automata method for phase unwrapping
[DE86-002124] N86-31289
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176987] N86-31308
Sequential and parallel matrix computations
[AD-A166062] N86-31320
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342
CSTAR star catalogue development N86-31434

ALLOCATIONS
Solving multi-state variable dynamic programming models using vector processing
[AD-A166763] N86-31244

ALLOYS
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
Refractory alloy performance: unresolved issues and status summary
[DE85-014657] N86-30849
Microstructure and properties of ferrous alloy weldments
[DE86-008368] N86-30850
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
Improved structural polymer alloys and composites
[AD-A166150] N86-30866

ALTIMETERS
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169

ALUMINUM
Grain boundary dislocation structures in 001 symmetric tilt boundaries in aluminum
[DE86-007003] N86-30846
Evaluation of the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium
[DE86-701579] N86-30859
Flexure strength analysis of Los Alamos ceramic bodies Al-13, Al-18, and MgO-Y2O3
[DE86-008576] N86-31081
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31368

ALUMINUM ALLOYS
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839
Theory of strengthening by ordered precipitates
[DE86-009355] N86-30861

ALUMINUM GALLIUM ARSENIDES

ALUMINUM GALLIUM ARSENIDES
Development of a thin AGaAs solar cell
[DE86-009544] N86-31112
Semiconductor alloy theory
[AD-A167306] N86-31387
ALUMINUM OXIDES
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
AMORPHOUS MATERIALS
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840
Crystallization of sputter deposited amorphous metal thin films
[DE86-008956] N86-31401
AMORPHOUS SEMICONDUCTORS
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385
AMPLIFICATION
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908
AMPLIFIERS
Optimized flashlamp pumping of disc amplifiers
[DE86-007121] N86-31043
Distributed synthetic aperture radar simulation N86-31413
ANALOG COMPUTERS
Magnetostatic wave application to microwave analog signal processing N86-30897
ANALOG DATA
A coherent VLSI design environment
[AD-A166848] N86-30944
ANALOG TO DIGITAL CONVERTERS
Synchronizer failure in A/D converters
[AD-A166819] N86-30942
ANALOGS
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436
ANALYSIS (MATHEMATICS)
Expected performance of m-solution backtracking
[NASA-CR-178162] N86-31236
Bootstrapping nonlinear least squares estimates in the Kalman filter model
[AD-A167099] N86-31311
ANALYZERS
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
Development of a pulse height analyzer
[DE86-700768] N86-31034
Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116
ANECHOIC CHAMBERS
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] N86-31337
ANGULAR MOMENTUM
Effects of previous disturbances on the meter factors of a vortex meter N86-30979
ANIMALS
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436
ANISOTROPIC PLATES
Anisotropic wing aeroelastic theories with warping effects N86-30659
ANISOTROPY
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings N86-30643
Variation of anisotropic behavior in structural optimization — aircraft composite structures N86-30656
Effects of anisotropic design on the static aeroelasticity of a swept wing — aeroelastic tailoring N86-30661
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496
Cosmic ray anisotropies at high energies N86-31518
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522
ANNEALING
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-008791] N86-31398
ANNUAL VARIATIONS
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31166
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
ANODIC COATINGS
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871
ANODIZING
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
ANOMALIES
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206
ANTARCTIC REGIONS
Mossbauer spectroscopy of extraterrestrial materials N86-31410
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31469
ANTENNA ARRAYS
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176989] N86-30891
Theoretical models of single-element LTSA antenna elements N86-30892
ANTENNA DESIGN
Hygrothermal characteristics of antenna materials — spacecraft antennas N86-30760
Development of an antenna structure for a deployable offset antenna N86-30797
Structural analysis, manufacturing and test evaluation of a polarization sensitive reflector N86-30798
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
ANTENNA RADIATION PATTERNS
Theoretical models of single-element LTSA antenna elements N86-30892
Near-field vector potentials for thin dipole antennas
[AD-A166542] N86-30902
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30931
ANTENNAS
Application of the LQG/LTR technique to robust controller synthesis for a large flexible space antenna
[NASA-TP-2560] N86-30900
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801
A 3-D analysis of Maxwell's equations for cavities of arbitrary shape
[DE86-007883] N86-30919
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933
ANTIMISTING FUELS
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] N86-30883
ANTIPROTONS
Experiment to measure the gravitational force on the antiproton
[DE86-006725] N86-31349
ANTIREFLECTION COATINGS
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
APERTURES
Multiaperture optics
[AD-A167060] N86-31361
Fresnel diffraction in an optical system with focusing
[DE86-006044] N86-31363
APEXES
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
APOGEE BOOST MOTORS
Fiber reinforced plastic cases for solid propellant motors N86-30793
APPALACHIAN MOUNTAINS (NORTH AMERICA)
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
APPLICATIONS PROGRAMS (COMPUTERS)
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30909
Performance of oil pumping rings: An analytical and experimental study
[NASA-CR-175083] N86-31000
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model
[DE86-009539] N86-31110
Representation for closed form significance testing in VL1 N86-31219
A discrete control model of PLANT N86-31220
Making the human-machine interface responsive to many classes of users
[DE86-003453] N86-31222
Ada (trade name) training curriculum. Real-time systems in Ada 1401 teacher's guide, volume 1
[AD-A166351] N86-31230
Ada (trade name) training curriculum. Real-time systems in Ada 1401 teacher's guide, volume 2
[AD-A166352] N86-31231
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31248
Interpreted multiprocess display control system
[DE86-008844] N86-31250
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009063] N86-31256
Package for solving large sparse systems of stiff ordinary differential equations
[DE86-009545] N86-31282
Vibration and structureborne noise in space station
[NASA-CR-177146] N86-31308
APPROACH
Intersatellite link design issues
[AD-A166761] N86-30904
APPROACH CONTROL
Aviation safety: Serious problems concerning the air traffic control work force
[PB86-194586] N86-30716
APPROXIMATION
Extrapolated midpoint rule for differential equations. Part 1: Expansion theorems
[IR-255-PT-1] N86-31303
Discrete approximation of eigenfunction expansions of self adjoint ordinary differential operators
[IR-263] N86-31304
AQUEOUS SOLUTIONS
Using temperature-programmed reaction for kinetic analysis of reactions in dilute aqueous solutions at high pressure
[DE86-003683] N86-30827
Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845
ARABSAT
Comparison of classical and cocuring manufacturing techniques for a CFRP honeycomb central tube — satellite central tube N86-30792
ARC HEATING
Laser techniques for arc jet plasma diagnostics: continuation of a feasibility and design study N86-31435

ARC MELTING
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753
ARCHITECTURE
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
ARCHITECTURE (COMPUTERS)
Advanced architectures for digital signal processors
[AD-A166921] N86-30905
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912
Topological properties of interconnection networks for parallel processors. A unified approach, appendix E
[AD-A167336] N86-31263
Space-variant optical systems
[AD-A167275] N86-31362
ARGON
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
ARGON LASERS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
ARIANE LAUNCH VEHICLE
Increasing use of composite structure on Ariane launchers N86-30786
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
The development of the Ariane 4 SPELDA --- Double-launch external structure (speida) N86-30758
ARID LANDS
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
ARIZONA
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
A regional 17-18 MA thermal event in Southwestern Arizona N86-31126
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136
Cenozoic extension and magmatism in Arizona N86-31158
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189
ARMED FORCES (UNITED STATES)
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440
ARRAYS
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342
The homestake surface-underground scintillators: Initial results N86-31515
ARTERIES
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213
ARTIFICIAL INTELLIGENCE
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
Chemistry Research Resource
[DE86-008765] N86-30811
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Intelligent interface for design and simulation
[DE86-000762] N86-31269
Automated reasoning: Basic research problems
[DE86-009214] N86-31270
Design criteria for expert systems N86-31411
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
A guide to lexical acquisition in the JANUS system
[AD-A166078] N86-31443
ARTIFICIAL SATELLITES
Gamma ray astronomy from satellites and balloons N86-31490
ASTROLABES
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31468
ASTRONAUT PERFORMANCE
Application of computer image enhancement techniques to shuttle hand-held photography N86-31416
ASTRONOMICAL CATALOGS
CSTAR star catalogue development N86-31434
ASTRONOMICAL COORDINATES
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31468
ASTRONOMICAL MODELS
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477
ASTRONOMICAL OBSERVATORIES
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466
ASTRONOMICAL PHOTOGRAPHY
The size, shape, density, and albedo of Ceres from its occultation of BD+8 deg 471
[NASA-CR-177099] N86-31465
ASTRONOMICAL SPECTROSCOPY
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466
ASTROPHYSICS
Activities of the Werner-Heisenberg Institute of Physics
[ISSN-0173-6256] N86-31350
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503
ASYMPTOTIC METHODS
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31265
ASYMPTOTIC PROPERTIES
Solutions of boundary value problems for the Tricomi-equation
[IR-247] N86-31301
The best bound in the L log L inequality of Hardy and Littlewood and its martingale counterpart
[IR-266] N86-31305
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314
ATMOSPHERIC CHEMISTRY
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31168
Chemical instrumentation for field studies of atmospheric wet deposition processes
[DE86-005255] N86-31175
ATMOSPHERIC CIRCULATION
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
Some atmospheric dispersion, wind and temperature statistics from Jervis Bay, Australian Capital Territory 1972 to 1974
[DE86-701370] N86-31192
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206
ATMOSPHERIC COMPOSITION
Theory and operation of the real-time data acquisition system for the NASA-LaRC differential absorption lidar (DIAL)
[NASA-CR-177151] N86-31036
Ground based ozone measurements in an equatorial rainforest
[INPE-3858-PRE-922] N86-31115
Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31168
Infrared airglow clutter
[AD-A166994] N86-31171
ATMOSPHERIC ENTRY
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30758
ATMOSPHERIC MODELS
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-66-97316] N86-30925
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206
Studies of the aurorally-induced ultraviolet emissions on the nightside of Venus
[NASA-CR-177004] N86-31478
ATMOSPHERIC PRESSURE
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
ATMOSPHERIC REFRACTION
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
ATMOSPHERIC SCATTERING
Striation effect on HF signals
[AD-A167017] N86-30909
ATMOSPHERIC SOUNDING
DeWitt field study: Surface flux observations, in situ soundings and remote sensing of conditions affecting the behavior of the mixed layer over land
[DE86-008942] N86-31177
Activities report of the Geophysical Institute
[ISSN-0283-1686] N86-31460
ATMOSPHERIC STRATIFICATION
DeWitt field study: Surface flux observations, in situ soundings and remote sensing of conditions affecting the behavior of the mixed layer over land
[DE86-008942] N86-31177
ATMOSPHERIC TEMPERATURE
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31166
Application of solar max ACRIM data to analyze solar-driven climatic variability on Earth
[NASA-CR-176855] N86-31183
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
Some atmospheric dispersion, wind and temperature statistics from Jervis Bay, Australian Capital Territory 1972 to 1974
[DE86-701370] N86-31192
ATOMIC PHYSICS
Elementary particle physics N86-31487
ATOMIC SPECTRA
Evidence for a new intensity formula from standard tables of spectral line intensities --- optical emission lines
[KGI-PREPRINT-085] N86-31369
ATOMIC STRUCTURE
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376
ATOMIZING
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
ATOMS
Studies of highly excited atoms
[AD-A166838] N86-31348
ATROPHY
Flow cytometry analysis of hormone receptors on human peripheral blood mononuclear cells to identify stress-induced neuroendocrine effects N86-31428
ATTITUDE (INCLINATION)
Grain boundary dislocation structures in 001 symmetric tilt boundaries in aluminum
[DE86-007003] N86-30846
ATTITUDE CONTROL
CSTAR star catalogue development N86-31434
AUDITORY STIMULI
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
AURORAL ZONES
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31481
AUSTENITE
Microstructure and properties of ferrous alloy weldments
[DE86-008368] N86-30850

AUSTENITIC STAINLESS STEELS
Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations
[DE86-008907] N86-30853
AUTOMATA THEORY
Cellular automata method for phase unwrapping
[DE86-002124] N86-31289
AUTOMATIC CONTROL
Space station automation study. Volume 1: Executive summary. Autonomous systems and assembly
[NASA-CR-176860] N86-30805
Advances in the study of the mechanical behavior of materials
[AD-A164856] N86-30838
Towards automatic Markov reliability modeling of computer architectures
[NASA-TM-89009] N86-31316
Superlattice optical bistability research
[AD-A167176] N86-31384
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
Investigation of local area networks for an orbiting space station N86-31417
AUTOMOBILE ENGINES
Experimental validation of diesel spray combustion
[DE86-007773] N86-30828
Engine heating device
[DE86-005095] N86-31055
Evaluation of a Stirling engine heater bypass with the NASA Lewis nodal-analysis performance code
[NASA-CR-179460] N86-31452
AUTONOMY
Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007384] N86-31290
AVIONICS
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30708
NASA and general aviation
[NASA-SP-485] N86-30720
AXIAL COMPRESSION LOADS
Analytical and experimental results of advanced composite stiffened panels under combined loads N86-30768
AXIAL LOADS
Influence of axial force on random vibration response of a structure N86-30667
AXISYMMETRIC BODIES
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] N86-30695
AXISYMMETRIC FLOW
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011

B

BACILLUS
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421
BACKGROUND RADIATION
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
Constraints on galaxy formation theories N86-31486
BACKSCATTERING
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30965
BAKING
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843
BALLOON-BORNE INSTRUMENTS
High energy electrons beyond 100 GEV observed by emulsion chamber N86-31519
BALLOONING MODES
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-006064] N86-31374
BANACH SPACE
Deterministic sensitivity theory for nonlinear systems: The forward and the adjoint method
[DE86-006512] N86-31318
BANDPASS FILTERS
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
BANDWIDTH
An investigation of dielectric loaded ridged waveguide
[AD-A167269] N86-30913
BARRIER LAYERS
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
BASALT
Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421
BATHYTHERMOGRAPHS
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205
BEACHES
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
BEAM INTERACTIONS
Relativistic klystron
[DE86-009217] N86-30951
BEAMS (RADIATION)
Sky luminance and direct beam illuminance
[PB86-196755] N86-31180
BEARING (DIRECTION)
Wild bearing analysis. EAAF (Extended Algorithm Analysis Family)
[NASA-CR-176985] N86-30930
BEDS (PROCESS ENGINEERING)
Study of settling of metallized sinter in reducing atmosphere
[BLL-M-36597-(5828.4)] N86-30836
BEHAVIOR
Transient excitation of anharmonic adspecies by pulsed laser radiation
[AD-A166308] N86-31038
BELLOWS
Low temperature rate controller
[AD-D012277] N86-31052
BERYLLIUM
Assessment of the application of the sputtering process to beryllium for hardening optical coatings
[DE86-006656] N86-30872
BETATRONS
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
BIBLIOGRAPHIES
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050
Astronautics and aeronautics, 1977: A chronology
[NASA-SP-4022] N86-31524
BIMETALS
Bimetallic fuel cell catalysts
[DE86-009259] N86-31108
BINARY ALLOYS
Approximate analysis of the formation of a buoyant solid sphere in a supercooled melt
[DE86-007882] N86-31022
Semiconductor alloy theory
[AD-A167306] N86-31387
BINARY MIXTURES
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750845] N86-31015
BINARY STARS
EX-111 thermal emission from hot white dwarfs: The suggested He abundance-temperature correlation. EX-112: The unique emission line white dwarf star GD 356
[NASA-CR-176868] N86-31470
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477
BINDERS (MATERIALS)
Hydrogen storage system
[DE86-006990] N86-30887
BIOASSAY
Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207
BIOGRAPHY
Topics on cosmic rays. Vol. 1: 60th anniversary of C.M.G. Lattes
[DE86-700674] N86-31523
BIOLOGICAL EFFECTS
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215
BIOSPHERE
Hierarchy theory and global change
[DE86-005154] N86-31190
BIOTECHNOLOGY
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
BIPOLAR TRANSISTORS
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166786] N86-30940
BIRD-AIRCRAFT COLLISIONS
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704
BIRDS
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704
BIREFRINGENCE
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367
BIVARIATE ANALYSIS
Extreme point methods in the determination of the structure of a class of bivariate distributions and some applications to contingency tables
[AD-A167230] N86-31386
BLADE TIPS
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070
BLAST LOADS
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
BLOOD
Induced erythrocythemia and maximal aerobic power. An examination of modifying factors
[AD-A166522] N86-31212
BLOOD PRESSURE
The effect of breathing elevated CO2 gas mixtures on tracking performance, blood pressure, and subjective tolerance at 1Gz
[AD-A165974] N86-31210
BOATTAILS
Aerodynamic drag reduction tests on a box-shaped vehicle
[NASA-CR-176982] N86-30692
BODIES OF REVOLUTION
Drag of bodies of revolution in cavitating flow
[DE86-005171] N86-31016
BOEING 720 AIRCRAFT
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
BOLTS
The strength of bolted joints in Kevlar RP — reinforced plastic (RP) N86-30785
Design of bolted joints in composites
[AGARD-R-727] N86-31084
BONDING
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071
BONE DEMINERALIZATION
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31439
BOOSTER ROCKET ENGINES
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30869
BOREL SETS
Function spaces of low Borel complexity
[IR-260] N86-31338
BORIDES
Flexure strength analysis of Los Alamos ceramic bodies Al-13, Al-18, and MgO-Y2O3
[DE86-008576] N86-31091
BORON
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30941
BOSONS
Induced Higgs couplings to neutral bosons in e+e- collisions
[USIP-85-08] N86-31351
Identification of neutral Higgs bosons in the DELPHI detector at LEP
[USIP-85-09] N86-31352
Elementary particle physics N86-31487
BOUNDARY LAYER FLOW
Boundary layer equations and methods of solution N86-30985

BOUNDARY LAYER SEPARATION
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166650] N86-31003
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] N86-31010
BOUNDARY LAYER TRANSITION
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics
[AD-A166960] N86-31009
BOUNDARY LAYERS
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166828] N86-31165
BOUNDARY VALUE PROBLEMS
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
The finite element method in fluid mechanics N86-30966
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267
Effects of stiffness
[DE86-009559] N86-31293
Solutions of boundary value problems for the Tricomi-equation
[IR-247] N86-31301
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31335
BOW WAVES
Observations of shock acceleration processes in the solar wind N86-31505
BRAKES (FOR ARRESTING MOTION)
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
BRAKING
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
BRAYTON CYCLE
Numerical study of the performance of latent heat storage for solar dynamic power systems
[DE86-006748] N86-31104
Development of a simulation code for a latent heat thermal energy storage system in a space station
[DE86-010070] N86-31113
BRAZING
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878
Zirconia to cast iron brazing for uncooled diesel engines
[DE86-006982] N86-31058
BREMSSTRAHLUNG
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31457
BRIGHTNESS
Simple, compact, high brightness source for X-ray lithography and X-ray radiography
[DE86-009723] N86-30956
BRITTLENESS
On the defect sensitivity of spacecraft typical thin CFRP laminates N86-30782
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-006785] N86-31082
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
BROADBAND
Phase comparison time delay estimation using wideband signals
[AD-A167025] N86-30910
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
BROKEN SYMMETRY
Superconformal Lagrangian without the need to introduce constraints
[DE86-009006] N86-31291
Obtaining the Einstein-Hilbert action from a superconformal theory
[DE86-009007] N86-31406
Concerning the transformation behavior of fields under the superconformal symmetries
[DE86-009008] N86-31407
BROWNIAN MOVEMENTS
An inequality for stopped Brownian motion
[IR-227] N86-31297
The Azema-Yor stopping time and ultimateness
[IR-273] N86-31331
BUCKLING
Hand calculation method for buckling of composite shell structures N86-30769
Assessing the effects of delaminations on the postbuckling strength of CRFP panels — aircraft structures N86-30781
BUDGETING
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440
BUMPY TORUSES
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
BURNING RATE
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809
Descriptive characterization of solid ingredients
[AD-A166874] N86-30885

C

C-141 AIRCRAFT
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357
CADMIUM
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843
CADMIUM TELLURIDES
Sensitivity analysis of a numerically simulated HgCdTe solidification process by statistical methods
[DE86-007935] N86-30847
Superlattice optical bistability research
[AD-A167163] N86-31383
CALCIUM
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
CALCULUS OF VARIATIONS
Variational coupling between Q-number and C-number dynamics
[DE86-700604] N86-31321
CALDERAS
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31128
CALENDARS
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189
CALIBRATING
Novel reentry vehicle instrument: The photodiode
[DE86-006234] N86-30808
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750679] N86-30848
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30888
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
Velocity precision measurements using laser Doppler anemometry N86-30966
European Economic Community (EEC) test stand comparison — gas flow measurement N86-30967
Accuracy of high pressure gas meter calibration in the Netherlands N86-30968
First measurements with a laser Doppler anemometer in a high pressure natural gas pipe N86-30971
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Practical experiences with High Pressure (HP) gas counters. Problems of operating calibration with HP N86-30974
Primary measurement — gas flow N86-30976
Vortex gas counter type WBZ 08. Practical experience N86-30980
High accuracy fuel flowmeter
[NASA-CR-174969] N86-31030
CALIFORNIA
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1962)
[AD-A166749] N86-31201
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204
CALLISTO
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
CANTILEVER BEAMS
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
CANYONS
Late Precambrian aulacogens of the North China craton N86-31155
CAPACITANCE
Measurement of internal capacitances of integrated circuits
[DE86-006494] N86-30948
CAPILLARY FLOW
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
CAPTIVE TESTS
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] N86-30700
CARBIDES
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
CARBON
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750679] N86-30848
Vegetable oils as diesel fuels. Reduction of carbon fouling
[DE86-750610] N86-30886
CARBON DIOXIDE
Space station molecular sieve development
[NASA-CR-178885] N86-30864
Transport and relaxation processes in supercritical fluids
[DE86-008329] N86-31023
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
The effect of breathing elevated CO2 gas mixtures on tracking performance, blood pressure, and subjective tolerance at 1Gz
[AD-A165974] N86-31210
CARBON FIBER REINFORCED PLASTICS
Thermal residual stresses in symmetric and unsymmetric carbon fiber reinforced plastics: Some tentative ways of evaluation N86-30762
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
Dimensional stability of CFRP tubes for space structures N86-30775
Assessing the effects of delaminations on the postbuckling strength of CRFP panels — aircraft structures N86-30781
On the defect sensitivity of spacecraft typical thin CFRP laminates N86-30782
Integrity of carbon fiber reinforced plastics. Structural elements, screening procedures, opportunities and open issues — spacecraft structures N86-30783
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790
Strength of carbon fiber composite/titanium bonded joints as used for SPAS-type structures N86-30794

Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems — spaceborne telescopes N86-30795

CARBON FIBERS

Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839

CARBON LASERS

Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379

CARBON MONOXIDE

A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167

CARBON STEELS

A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865

CARNOT CYCLE

Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430

CARRIER FREQUENCIES

Phase comparison time delay estimation using wideband signals
[AD-A167025] N86-30910

CARTESIAN COORDINATES

Development and evaluation of DOTTOR, a computer code to couple two-dimensional to three-dimensional discrete ordinates calculations
[DE86-010081] N86-31259

CASCADE FLOW

Theoretical flutter investigations on a plane cascade in incompressible flow — axial flow compressors and turbines N86-30635

Application of unsteady wing collocation methods to cascades in subsonic flow N86-30636

CASCADE WIND TUNNELS

Flow measurements in a centrifugal diffusor test device
[AD-A166758] N86-31004

CASES (CONTAINERS)

Container for multichip hybrid package
[AD-D012308] N86-30947

CASTINGS

Effect of manufacturing processes on structural allowables, phase 1
[AD-A166857] N86-30842

CAVITATION FLOW

Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733

Orifice plate and differential pressure measurement N86-30972

Drag of bodies of revolution in cavitating flow
[DE86-005171] N86-31016

CAVITY RESONATORS

Triple cavity laser
[AD-D012292] N86-31042

CELESTIAL GEODESY

Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31468

CENTRAL ATLANTIC REGION (US)

Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187

CENTRAL PROCESSING UNITS

Data flow accelerator module for general purpose processors
[DE86-008405] N86-31233

Towards automatic Markov reliability modeling of computer architectures
[NASA-TM-89009] N86-31316

CENTRIFUGAL COMPRESSORS

Flow measurements in a centrifugal diffusor test device
[AD-A166758] N86-31004

CERAMIC BONDING

Joining of ceramics for high temperature applications
[DE86-751572] N86-30878

CERAMICS

Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813

Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815

Corrosion of SiC ceramics in synthetic combustion atmospheres containing halides
[DE86-006732] N86-30873

Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879

Needs assessment for nondestructive testing and materials characterization for improved reliability in structural ceramics for heat engines
[DE86-010039] N86-30881

Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30882

Flexure strength analysis of Los Alamos ceramic bodies Al-13, Al-18, and MgO-Y2O3
[DE86-008576] N86-31081

Diffraction and microscopy studies of the structure of grain boundaries in Fe, Fe-base alloys and ceramic materials
[DE86-007983] N86-31393

CEREBRAL CORTEX

Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216

CERENKOV COUNTERS

Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511

Studies of air showers produced by primaries 10(16) eV using a combined scintillation and water-Cerenkov array N86-31514

CERENKOV RADIATION

Cerenkov radiation and electromagnetic pulse produced by electron beams traversing a finite path in air
[AD-A167058] N86-30911

Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502

Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506

Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31508

CERES ASTEROID

The size, shape, density, and albedo of Ceres from its occultation of BD+8 deg 471
[NASA-CR-177089] N86-31465

CHANNEL FLOW

Solution method of parabolized Navier-Stokes equations — turbomachine bladings N86-30990

CHAOS

Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007384] N86-31290

CHARGE CARRIERS

Heterojunction: D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388

CHARGE DISTRIBUTION

Core level shifts in semiconductors: A study of the electrostatic model
[DE85-703224] N86-31402

CHARGE TRANSFER

Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388

CHEMICAL ANALYSIS

Chemistry Research Resource
[DE86-008765] N86-30811

Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841

Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116

CHEMICAL BONDS

Semiconductor alloy theory
[AD-A167306] N86-31387

Core level shifts in semiconductors: A study of the electrostatic model
[DE85-703224] N86-31402

CHEMICAL COMPOSITION

Megajoule laser glass development
[DE86-006731] N86-30874

Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207

Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466

Galactic cosmic ray composition N86-31492

Emulsion chamber observations and interpretation (HE 3) N86-31499

Muons and neutrinos N86-31501

CHEMICAL REACTIONS

Potassium-water reactions in the vapor phase
[OEFZS-4327] N86-30833

Effect of surface corrosion on glass fracture
[DE86-008404] N86-30876

Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30882

Chemically reacting turbulent flow
[PB86-196722] N86-31029

Fuel cell reactions in super acid electrolytes
[PB86-201084] N86-31114

Computer simulation of surface and film processes
[NASA-CR-176966] N86-31377

Review and analysis of high temperature chemical reactions and the effect of non-equilibrium conditions N86-31420

CHEMILUMINESCENCE

The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821

CHEMISORPTION

In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835

Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379

CHINA

Late Precambrian aulacogens of the North China craton N86-31155

CHIPS (ELECTRONICS)

Container for multichip hybrid package
[AD-D012308] N86-30947

Development of dynamic very large scale integration memories
[BMFT-FB-T-85-176] N86-31234

CHLORELLA

Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207

CHLORIDES

Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845

Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations
[DE86-008907] N86-30853

CHROMIC ACID

An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867

CHROMIUM

Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841

Study of the polarization for Incoloy 800 and for the stainless steel AISI 304 in mixtures of iron, nickel and chromium chlorides
[DE86-701576] N86-30858

CHROMIUM ALLOYS

Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-008005] N86-30852

CHRONOLOGY

Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415

CINEMATOGRAPHY

Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217

CIRCLES (GEOMETRY)

Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908

CIRCUIT BOARDS

Testability measures on a state-of-the-art circuit
[AD-A165978] N86-30935

CIRCUIT RELIABILITY

A high-speed asynchronous communication technique for MOS (Metal-Oxide-Semiconductor) VLSI systems
[AD-A166846] N86-30943

CIRCUITS

Superlattice optical bistability research
[AD-A167176] N86-31384

CIRCULAR CYLINDERS

Design and development of the graphite epoxy structure for CS-3 satellite N86-30789

On the development of a corrugated CFRP central cylinder for satellites N86-30791

CIRCULAR WAVEGUIDES

Circular waveguide mode converters at 140 GHz
[DE86-009075] N86-30953

CIRCULATION CONTROL AIRFOILS

International Aviation (selected articles)
[AD-A166748] N86-30690

Navier-Stokes computations for circulation controlled airfoils
[AIAA-85-1587] N86-30885

CIVIL AVIATION

NASA and general aviation
[NASA-SP-485] N86-30730

Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736

CLASSIFICATIONS
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31469

CLEARANCES
Store separation flight testing
[AGARD-AG-300-VOL-5] N86-30727

CLIMATE
Application of solar max ACRIM data to analyze solar-driven climatic variability on Earth
[NASA-CR-176855] N86-31183

CLIMATOLOGY
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
Introduction to the CCM modular processor (version PROC01)
[PB86-188679] N86-31196
CCM modular processor users' guide (version PROC01)
[PB86-187069] N86-31197

CLINICAL MEDICINE
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431

CLOSED ECOLOGICAL SYSTEMS
Space station molecular sieve development
[NASA-CR-178885] N86-30864
Defining reclaimed water potability requirements N86-31422

CLOUD COVER
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189

CLOUD DISPERSAL
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172

CLOUD PHYSICS
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172

CLOUDS
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172

CLOUDS (METEOROLOGY)
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166628] N86-31185

CLUTTER
Infrared airglow clutter
[AD-A166994] N86-31171

CMOS
Measurement of internal capacitances of integrated circuits
[DE86-006494] N86-30948
Testing, design and modeling issues in radiation-hardened CMOS integrated circuits
[DE86-007707] N86-30949
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957

COASTS
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

COATINGS
Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045

COBALT
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841

COBALT ALLOYS
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815

CODING
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
Defense acquisition management data system code translation manual fiscal year 1985
[AD-A165987] N86-31442

COEFFICIENT OF FRICTION
In situ examination of segregation and wear processes of precious metal electrical contact alloys
[DE86-009089] N86-30954

COEFFICIENTS
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31281

COLLAPSE
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129

COLLIMATION
Cosmic jets N86-31484

COLLISION AVOIDANCE
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] N86-30712
Aviation safety: Serious problems concerning the air traffic control work force
[PB86-194586] N86-30716

COLLOCATION
Application of unsteady wing collocation methods to cascades in subsonic flow N86-30636

COLLOIDS
Phase relations and miscibility in polymer blends containing copolymers
[AD-A166773] N86-30868

COLORADO
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

COLORADO RIVER (NORTH AMERICA)
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164

COMBUSTIBLE FLOW
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
Experimental validation of diesel spray combustion
[DE86-007773] N86-30828

COMBUSTION
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Computation of adiabatic flame temperatures and other thermodynamic quantities
[DE86-009388] N86-31408

COMBUSTION CHAMBERS
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] N86-30735
Vegetable oils as diesel fuels. Reduction of carbon fouling
[DE86-750610] N86-30886

COMBUSTION CONTROL
Fire control method and analytical model for large liquid hydrocarbon pool fires N86-31419

COMBUSTION PRODUCTS
Corrosion of SiC ceramics in synthetic combustion atmospheres containing halides
[DE86-006732] N86-30873

COMBUSTION STABILITY
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809

COMMAND AND CONTROL
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440

COMMAND LANGUAGES
Integration of an expert system into a user interface language demonstration N86-31432

COMMERCIAL AIRCRAFT
Aircraft accident report: Provincetown, Boston Airlines Flight 1039, Embraer Bandeirante, EMB-110P1, N96PB, Jacksonville, Florida, December 6, 1984
[PB86-910405] N86-30703
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] N86-30712

COMMUNICATION EQUIPMENT
A Low-Data-Rate Voice Transmission System (LDRVTS) for HF communication
[AD-A166946] N86-30906

COMMUNICATION NETWORKS
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Intersatellite link design issues
[AD-A166761] N86-30904
Methods for developing jam-resistant security communications networks at fixed-site facilities
[DE86-001321] N86-30920
A coherent VLSI design environment
[AD-A166848] N86-30944
Topological properties of interconnection networks for parallel processors. A unified approach, appendix E
[AD-A167336] N86-31263

COMMUNICATION SATELLITES
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
On the development of a corrugated CFRP central cylinder for satellites N86-30791

COMMUNITIES
CCM modular processor users' guide (version PROC01)
[PB86-187069] N86-31197

COMPARISON
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694
Results of comparison studies of infrared radiative transfer models
[DE86-006531] N86-31191

COMPENSATORS
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31257

COMPILERS
Application of Ada higher order language to guidance and control
[AGARD-LS-146] N86-30740
Ada (trade name) compiler validation summary report: AFATL Ada cross-compiler version 1.0, CDC cyber host/Zilog z8002 target
[AD-A166212] N86-31229
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 2
[AD-A166352] N86-31231
Ada (trade name) compiler validation summary report: Verdix Ada development system, version 5.2 for the sequent balance under DYNIX, release 1.3.2
[AD-A167231] N86-31232

COMPLEX SYSTEMS
Global coordinates and exact aberration calculations applied to physical optics modeling of complex optical systems
[DE86-008751] N86-31366

COMPLEX VARIABLES
The Hopf algebra of symmetric functions
[IR-250] N86-31325

COMPONENT RELIABILITY
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] N86-30812
JPL preferred parts list: Reliable electronic components
[NASA-CR-176258] N86-30889

COMPOSITE MATERIALS
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Improved structural polymer alloys and composites
[AD-A166150] N86-30866
Design of bolted joints in composites
[AGARD-R-727] N86-31064

COMPOSITE STRUCTURES
Variation of anisotropic behavior in structural optimization — aircraft composite structures N86-30656
Proceedings of a Workshop on Composites Design for Space Applications — conference
[ESA-SP-243] N86-30758
The application of composites to space structures: Guidelines on important aspects for the designer N86-30759
Hygrothermal characteristics of antenna materials — spacecraft antennas N86-30760
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763
Orthotropic properties of layered fiber composites N86-30766
Analytical and experimental results of advanced composite stiffened panels under combined loads N86-30768
Hand calculation method for buckling of composite shell structures N86-30769
Adequate fiber reinforced structural elements in load introduction area of fiber reinforced shells N86-30770
New prediction methods for composites hygrothermal behavior N86-30771
Design and manufacturing aspects of space trusses N86-30772
Delamination fracture toughness of composite spacecraft structures N86-30777
Industrial calculation of damage tolerance and stress allowables in components made of composite materials using the PAM-FISS/biphase material model N86-30779
Developments in the nondestructive evaluation (NDE) of composite materials N86-30785
Increasing use of composite structure on Ariane launchers N86-30786
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
The development of the Ariane 4 SPELDA — Double-launch external structure (speida) N86-30788
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
Comparison of classical and cocuring manufacturing techniques for a CFRP honeycomb central tube — satellite central tube N86-30792
Strength of carbon fiber composite/titanium bonded joints as used for SPAS-type structures N86-30794
Design and development of the Advanced Rigid Array (ARA) solar panel — composite structures N86-30796
A step towards an ESA composites design handbook for space structure applications N86-30799
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] N86-30812
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
Holography: The nondestructive testing of composite structures
[SNIAS-861-430-103] N86-30817
COMPRESSED GAS
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165989] N86-30884
COMPRESSIBILITY
Measurement and calculation of the density of natural gases N86-30969
COMPRESSIBLE FLOW
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Introduction to Computational Fluid Dynamics
[VKI-LS-1986-01] N86-30983
Implicit time dependent methods for inviscid and viscous compressible flows N86-30987
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Integrated gradients: A derivation of some difference forms for the equation of motion for compressible flow in two-dimensional Lagrangian hydrodynamics, using integration of pressures over surfaces
[DE86-008325] N86-31020
COMPRESSING
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
COMPRESSION WAVES
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136
COMPRESSOR ROTORS
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor
[AD-A166759] N86-30734
COMPUTATION
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243
Topological properties of interconnection networks for parallel processors. A unified approach, appendix E
[AD-A167336] N86-31263
The computational complexity of two-level morphology
[AD-A165991] N86-31266
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
Sequential and parallel matrix computations
[AD-A166062] N86-31320
COMPUTATIONAL ASTROPHYSICS
Homoclinic phenomena in the gravitational collapse
[DE86-700671] N86-31472
COMPUTATIONAL FLUID DYNAMICS
Transonic equivalent strip method for aeroelastic applications N86-30625
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] N86-30697
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] N86-30731
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961
Introduction to Computational Fluid Dynamics
[VKI-LS-1986-01] N86-30983
Computational fluid dynamics, introduction N86-30984
Boundary layer equations and methods of solution N86-30985
The finite element method in fluid mechanics N86-30986
Implicit time dependent methods for inviscid and viscous compressible flows N86-30987
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings — conference
[VKI-LS-1986-02] N86-30988
Solution method of parabolized Navier-Stokes equations — turbomachine bladings N86-30990
Numerical modeling of Navier-Stokes equations N86-30991
Introduction to grid generation systems in turbomachinery N86-30993
Efficient solution methods for the Navier-Stokes equations N86-30994
Navier-Stokes computations for circulation controlled airfoils
[AIAA-85-1587] N86-30995
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] N86-30996
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166650] N86-31003
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics
[AD-A166960] N86-31009
CALTECH-DOE program on numerical analysis, scientific computing and fundamental studies of motion, energy and mass transfer in fluids
[DE86-006369] N86-31021
Summary of research in applied mathematics, numerical analysis, and computer sciences
[NASA-CR-178119] N86-31227
Hypercube algorithms and implementations
[DE86-007439] N86-31253
COMPUTATIONAL GRIDS
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] N86-30697
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166788] N86-30940
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30958
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961
Introduction to grid generation systems in turbomachinery N86-30993
Multigrid convergence acceleration techniques for explicit Euler solvers and applications to Navier-Stokes calculations N86-30997
The asymptotic expansion of the global error of the box scheme in a stiff case
[IR-251] N88-31302
Extremal digraphs without directed paths of length three or two
[MEMO-449] N86-31307
Development of a numerical procedure to map a general 3-d body onto a near-circle N86-31420
COMPUTER AIDED DESIGN
A coherent VLSI design environment
[AD-A166846] N86-30944
Performance of oil pumping rings: An analytical and experimental study
[NASA-CR-175083] N86-31000
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31066
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
Computer-aided fabrication system implementation
[AD-A166787] N86-31245
In-house CAD training: A realistic approach
[DE86-008926] N86-31251
Using SMF records in managing a CADAM system
[DE86-006408] N86-31252
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264
Intelligent interface for design and simulation
[DE86-000762] N86-31269
Engineering graphics data entry for space station data base N86-31425
Automation of review/approval cycle of MCAUTO CAD/CAM generated drawings and documents N86-31429
COMPUTER AIDED MANUFACTURING
Computer-aided fabrication system implementation
[AD-A166787] N86-31245
In-house CAD training: A realistic approach
[DE86-008926] N86-31251
Using SMF records in managing a CADAM system
[DE86-006408] N86-31252
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264
COMPUTER AIDED MAPPING
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096
COMPUTER ASSISTED INSTRUCTION
Computer-aided fabrication system implementation
[AD-A166787] N86-31245
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456

COMPUTER GRAPHICS
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241
Semiconductor device modeling on a workstation
[DE86-001125] N86-31249
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257
Engineering graphics data entry for space station data base N86-31425
Automation of review/approval cycle of MCAUTO CAD/CAM generated drawings and documents N86-31429

COMPUTER INFORMATION SECURITY
Software protection: Myth or reality
[DE86-003719] N86-31247

COMPUTER NETWORKS
Optimal partitioning of random programs across two processors
[NASA-CR-178159] N86-31261
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262
Topological properties of interconnection networks for parallel processors. A unified approach, appendix E
[AD-A167336] N86-31263
Investigation of local area networks for an orbiting space station N86-31417

COMPUTER PROGRAMMING
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
Ada (Trade name) curriculum. Basic Ada programming I202 teacher's guide. Laboratory manual and exercises
[AD-A166043] N86-31238
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 1
[AD-A166366] N86-31239
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 2
[AD-A166367] N86-31240
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243
PASCAL for engineers: A course including OMEGASOF PASCAL for microcomputers
[DE86-701701] N86-31258
Development of low-energy X-ray spectrograph system
[AD-A166195] N86-31347
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166664] N86-31362
Design criteria for expert systems N86-31411

COMPUTER PROGRAMS
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual
[DE86-780411] N86-31024
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096
Pilot interaction with automated airborne decision making systems
[NASA-CR-176966] N86-31218
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 1
[AD-A166366] N86-31239
Development and evaluation of DOTTOR, a computer code to couple two-dimensional to three-dimensional discrete ordinates calculations
[DE86-010061] N86-31259
Automated reasoning: Basic research problems
[DE86-009214] N86-31270
Deterministic sensitivity theory for nonlinear systems: The forward and the adjoint method
[DE86-009512] N86-31318
Mossbauer spectroscopy of extraterrestrial materials N86-31410
A primer for program managers: Embedded software acquisition
[AD-A166731] N86-31441

COMPUTER SYSTEMS PROGRAMS
Application of Ada higher order language to guidance and control
[AGARD-LS-146] N86-30740
Damage zone fracture analysis of fibrous composites N86-30778
Industrial calculation of damage tolerance and stress allowables in components made of composite materials using the PAM-FISS/biphase material model N86-30779
Software protection: Myth or reality
[DE86-003719] N86-31247

COMPUTER TECHNIQUES
Summary of research in applied mathematics, numerical analysis, and computer sciences
[NASA-CR-178119] N86-31227
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Computer-aided fabrication system implementation
[AD-A166787] N86-31245
Space-variant optical systems
[AD-A167275] N86-31362
Defense acquisition management data system code translation manual fiscal year 1985
[AD-A165987] N86-31442

COMPUTERIZED SIMULATION
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
Control of large flexible systems by spatial modal input-distribution control
[AD-A166912] N86-30803
Sensitivity analysis of a numerically simulated HgCdTe solidification process by statistical methods
[DE86-007935] N86-30847
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30958
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998
Numerical experiments with CONCHAS-SPRAY: installation of the FLOE algorithm
[DE86-007575] N86-31018
Acoustic damping for explicit calculations of fluid flow at low Mach number
[DE86-007576] N86-31019
Remarks on the choice of a stiff ordinary differential equation solver for the solution of fluid flow problems
[DE86-010080] N86-31028
Numerical study of the performance of latent heat storage for solar dynamic power systems
[DE86-006748] N86-31104
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model
[DE86-009539] N86-31110
Solving multi-state variable dynamic programming models using vector processing
[AD-A166763] N86-31244
Semiconductor device modeling on a workstation
[DE86-001125] N86-31249
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31260
Intelligent interface for design and simulation
[DE86-000762] N86-31269
Towards automatic Markov reliability modeling of computer architectures
[NASA-TM-89009] N86-31316
Global coordinates and exact aberration calculations applied to physical optics modeling of complex optical systems
[DE86-008751] N86-31366
Computer simulation of surface and film processes
[NASA-CR-176966] N86-31377
Grain growth phenomena in films: A Monte Carlo approach
[DE86-008755] N86-31397
Distributed synthetic aperture radar simulation N86-31413
Evaluation of a Stirling engine heater bypass with the NASA Lewis nodal-analysis performance code
[NASA-CR-179460] N86-31452

COMPUTERS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714
Free-electron lasers for strategic defense: The benefits of scientific open scientific exchange
[DE86-006033] N86-31046
Making the human-machine interface responsive to many classes of users
[DE86-003453] N86-31222

CONCENTRATION (COMPOSITION)
Chemically reacting turbulent flow
[PB86-196722] N86-31029

CONCRETES
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080

CONCURRENT PROCESSING
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 1
[AD-A166351] N86-31230
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 2
[AD-A166352] N86-31231

CONDUCTORS
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752

CONFERENCES
The Second International Symposium on Aeroelasticity and Structural Dynamics
[DGLR-85-02] N86-30627
Proceedings of a Workshop on Composites Design for Space Applications — conference
[ESA-SP-243] N86-30758
Problems of large gas flow measurements at high and low pressures — conference
[PTB-ME-58] N86-30962
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings — conference
[VKI-LS-1986-02] N86-30988
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
Proceedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31106

CONFIDENCE LIMITS
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31260
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176987] N86-31308

CONFORMAL MAPPING
Development o a numerical procedure to map a general 3-d body onto a near-circle N86-31420

CONGRESSIONAL REPORTS
The Department of Defense statement on science in the mission agencies and federal laboratories before the Task Force on Science Policy of the Committee on Science and Technology of the United States House of Representatives, 99th Congress, first session
[AD-A166041] N86-31438
Department of Housing and Urban Development-Independent Agecies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449
National Aeronautics and Space Administration N86-31450

CONICS
Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] N86-31237

CONJUGATE GRADIENT METHOD
Variation of anisotropic behavior in structural optimization — aircraft composite structures N86-30656
Time integration and conjugate gradient methods for the incompressible Navier-Stokes equations
[DE86-007177] N86-31027
Hypercube algorithms and implementations
[DE86-007439] N86-31253

CONSECUTIVE EVENTS
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31481

CONSERVATION EQUATIONS
Derivation of the equations of conservation of mass, momentum and energy of compressible fluid mech anics in both Lagrangian and Eulerian forms from an integral viewpoint
[DE86-007210] N86-31026

CONSERVATION LAWS
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] N86-30999

Derivation of the equations of conservation of mass, momentum and energy of compressible fluid mech anics in both Lagrangian and Eulerian forms from an integral viewpoint
[DE86-007210] N86-31026
The effects of strain heating in lithospheric stretching models N86-31163

CONSTRAINTS
CSTAR star catalogue development N86-31434

CONTAMINANTS
Acid deposition: A national problem
[DE86-007810] N86-31117

CONTAMINATION
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939

CONTINENTS
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Thermal-mechanical response to simple shear extension N86-31133
Extensional tectonics on continents and the transport of heat and matter N86-31149
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
The effects of strain heating in lithospheric stretching models N86-31163

CONTINGENCY
Extreme point methods in the determination of the structure of a class of bivariate distributions and some applications to contingency tables
[AD-A167230] N86-31285

CONTINUITY
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31281

CONTINUITY (MATHEMATICS)
Analytical finite elements N86-30666

CONTINUOUS WAVE LASERS
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870

CONTRACT MANAGEMENT
Defense acquisition management data system code translation manual fiscal year 1985
[AD-A165987] N86-31442

CONTROL
Using temperature-programmed reaction for kinetic analysis of reactions in dilute aqueous solutions at high pressure
[DE86-003683] N86-30827

CONTROL EQUIPMENT
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] N86-30732

CONTROL MOMENT GYROSCOPES
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801

CONTROL SURFACES
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30756

CONTROL SYSTEMS DESIGN
Flutter calculation by a new program N86-30645
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques N86-30647
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory N86-30651
Aspects of active isolation as applied to a satellite structure with shape precision payload N86-30653
Application of Ada higher order language to guidance and control
[AGARD-LS-146] N86-30740
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801
Space station automation study. Volume 1: Executive summary. Autonomous systems and assembly
[NASA-CR-176860] N86-30805
A discrete control model of PLANT N86-31220
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447

CONTROL THEORY
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
Optimum parameter identification in a dynamic system described by a stochastic linear differential equation with control functions
[ESA-86-97280] N86-31272

CONTROLLED ATMOSPHERES
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30890

CONTROLLERS
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807
Synthesis of a self-timed controller for a successive-approximation A/D converter
[AD-A166788] N86-30941
Low temperature rate controller
[AD-D012277] N86-31052

CONVECTIVE HEAT TRANSFER
Experimental validation of diesel spray combustion
[DE86-007773] N86-30828
A numerical study of forced lithospheric thinning N86-31159
An analysis of ullage heat transfer in the orbital refueling system N86-31424

CONVERGENCE
Multigrid convergence acceleration techniques for explicit Euler solvers and applications to Navier-Stokes calculations N86-30997
Development and application of the P-version of the finite element method
[AD-A169056] N86-31279
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284

CONVERGENT-DIVERGENT NOZZLES
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694

CONVEXITY
Binary convexities and distributive lattices
[IR-225] N86-31296
Convex Hilbert cubes in superextensions
[IR-254] N86-31327
Invariant arcs, Whitney levels, and Kelley continua
[IR-268] N86-31329

COOLING
Development of thermoelectric water heating-cooling devices
[AD-A166949] N86-31221
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380

COORDINATE TRANSFORMATIONS
Concerning the transformation behavior of fields under the superconformal symmetries
[DE86-009006] N86-31407

COORDINATES
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006

COPOLYMERS
Improved structural polymer alloys and composites
[AD-A166150] N86-30866
Phase relations and miscibility in polymer blends containing copolymers
[AD-A166773] N86-30868

COPPER
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857

COPPER OXIDES
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856

CORES
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131

CORRECTION
Modern differential pressure gas counter (WIGZ) measurement N86-30973

CORROSION
Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845
Evaluation of the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium
[DE86-701579] N86-30859
Corrosion of SiC ceramics in synthetic combustion atmospheres containing halides
[DE86-006732] N86-30873
Effect of surface corrosion on glass fracture
[DE86-008404] N86-30876

CORROSION PREVENTION
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871

CORROSION RESISTANCE
The variation of corrosion potential with time for coated metal surfaces
[NASA-TP-2636] N86-30837
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-008005] N86-30852
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871

CORROSION TEST LOOPS
Potassium natural convection loop HT4, operating report number 1
[OEFZS-4329] N86-30862

CORROSION TESTS
Potassium natural convection loop HT4, operating report number 1
[OEFZS-4329] N86-30862
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865

CORRUGATED SHELLS
On the development of a corrugated CFRP central cylinder for satellites N86-30791

COSMIC RAY SHOWERS
Extensive air showers (HE-4) N86-31500
The cosmic ray spectrum above 10(17) eV N86-31512
Studies of air showers produced by primaries 10(16) eV using a combined scintillation and water-Cerenkov array N86-31514

COSMIC RAYS
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
Nineteenth International Cosmic Ray Conference. Conference papers: Invited rapporteur, highlight, miscellaneous, volume 9
[NASA-CP-2376-VOL-9] N86-31483
Extragalactic astronomy N86-31489
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
High energy interactions of cosmic ray particles N86-31496
Emulsion chamber observations and interpretation (HE 3) N86-31499
Muons and neutrinos N86-31501
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511
The homestake surface-underground scintillators: Initial results N86-31515
Automated scanning of plastic nuclear track detectors using the Minnesota star scanner N86-31517
Cosmic ray anisotropies at high energies N86-31518
High energy electrons beyond 100 GEV observed by emulsion chamber N86-31519
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520
Elemental abundances in corotating events N86-31521
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522
Topics on cosmic rays. Vol. 1: 60th anniversary of C.M.G. Lattes
[DE86-700674] N86-31523

COSMOLOGY
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700669] N86-31471
Homoclinic phenomena in the gravitational collapse
[DE86-700671] N86-31472
Relativistic cosmologies with closed, locally homogeneous space sections
[DE86-700673] N86-31473
Cosmogenic nuclei N86-31486

COST ANALYSIS
Practical experiences with High Pressure (HP) gas counters. Problems of operating calibration with HP N86-30974
Primary measurement — gas flow N86-30976

COST EFFECTIVENESS
Hypercube algorithms and implementations
[DE86-007439] N86-31253
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372

COST REDUCTION
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
COSTS
Technical and economic assessments of electrochemical energy storage systems. Volume 1: Executive summary
[DE86-006855] N86-31102
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446
COUETTE FLOW
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
COUPLED MODES
Rapid vibration mode analysis of aircraft with external stores N86-30679
COUPLERS
Analysis of a doubly coupled single fiber resonator
[AD-A166851] N86-31033
COVARIANCE
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314
Sieves for Gaussian processes
[AD-A166055] N86-31319
CRACK INITIATION
Dimensional stability of CFRP tubes for space structures N86-30775
Effect of surface corrosion on glass fracture
[DE86-008404] N86-30876
CRACK PROPAGATION
Model of crack electrochemistry
[DE86-009346] N86-30830
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
Effect of surface corrosion on glass fracture
[DE86-008404] N86-30876
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
Computer simulation of surface and film processes
[NASA-CR-176966] N86-31377
CRACKING (FRACTURING)
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071
CRACKS
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
Model of crack electrochemistry
[DE86-009346] N86-30830
Acoustic emission transient recording
[DE86-006908] N86-31066
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31082
CRASHES
Aircraft accident report: Provincetown, Boston Airlines Flight 1039, Embraer Bandeirante, EMB-110P1, N96PB, Jacksonville, Florida, December 6, 1984
[PB86-910405] N86-30703
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
CRASHWORTHINESS
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] N86-30702
Crashworthiness of airframes
[AGARD-R-737] N86-30709
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
CRATONS
Late Precambrian aulacogens of the North China craton N86-31155
CRAY COMPUTERS
Development and evaluation of DOTTOR, a computer code to couple two-dimensional to three-dimensional discrete ordinates calculations
[DE86-010081] N86-31259
CRITERIA
Integrity of carbon fiber reinforced plastics. Structural elements, screening procedures, opportunities and open issues --- spacecraft structures N86-30783
CRITICAL VELOCITY
Active plasma release experiments
[NASA-CR-176897] N86-31462
A magnetospheric critical velocity experiment: Particle results N86-31463
CROSSLINKING
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
CRUSTAL FRACTURES
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
Rifting on Venus: Implications for lithospheric structure N86-31121
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31125
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31126
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
Lithospheric and crustal thinning N86-31147
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
Late Precambrian aulacogens of the North China craton N86-31155
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
CRYOGENIC FLUID STORAGE
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863
CRYOGENICS
Chemistry Research Resource
[DE86-008765] N86-30811
CRYPTOGRAPHY
Software protection: Myth or reality
[DE86-003719] N86-31247
CRYSTAL DEFECTS
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376
CRYSTAL DISLOCATIONS
Grain boundary dislocation structures in 001 symmetric tilt boundaries in aluminum
[DE86-007003] N86-30846
CRYSTAL GROWTH
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
Growth of large GSGG crystals
[DE86-006700] N86-31391
Grain growth phenomena in films: A Monte Carlo approach
[DE86-008755] N86-31397
CRYSTAL LATTICES
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
Grain boundary dislocation structures in 001 symmetric tilt boundaries in aluminum
[DE86-007003] N86-30846
Superlattice optical bistability research
[AD-A167163] N86-31383
Superlattice optical bistability research
[AD-A167176] N86-31384
CRYSTAL STRUCTURE
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
Growth of large GSGG crystals
[DE86-006700] N86-31391
CRYSTAL SURFACES
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
CRYSTALLIZATION
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
In-situ SAX investigations of isothermal crystallization in poly(TMPS) fractions
[DE86-003816] N86-31392
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
CRYSTALLOGRAPHY
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
CRYSTALS
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
CULTURE TECHNIQUES
Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207
CURING
Comparison of classical and cocuring manufacturing techniques for a CFRP honeycomb central tube --- satellite central tube N86-30792
CURVES (GEOMETRY)
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
CYCLIC LOADS
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855
CYCLOTRON RESONANCE DEVICES
One dimensional models for relativistic electron beam diode design
[AD-A165953] N86-30934
Circular waveguide mode converters at 140 GHz
[DE86-009075] N86-30953
CYLINDRICAL BODIES
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
CYLINDRICAL SHELLS
Adequate fiber reinforced structural elements in load introduction area of fiber reinforced shells N86-30770
Vibration and structureborne noise in space station
[NASA-CR-177146] N86-31336
CYTOGENESIS
In vitro cytogenetic studies of organic chemicals found as contaminants in spacecraft cabin atmospheres N86-31433
CZOCHRALSKI METHOD
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381

D

DAMAGE
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045
DAMAGE ASSESSMENT
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214
DAMPING
Damping of composites N86-30764
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-86-97316] N86-30925

Acoustic damping for explicit calculations of fluid flow at low Mach number
[DE86-007576] N86-31019
Low temperature rate controller
[AD-D012277] N86-31052

DATA ACQUISITION
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
Theory and operation of the real-time data acquisition system for the NASA-LaRC differential absorption lidar (DIAL)
[NASA-CR-177151] N86-31036
Los Alamos software development tools
[DE86-006024] N86-31248
Interpreted multiprocess display control system
[DE86-008844] N86-31250
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264
Development of low-energy X-ray spectrograph system
[AD-A166195] N86-31347
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447
Active plasma release experiments
[NASA-CR-176897] N86-31462

DATA BASE MANAGEMENT SYSTEMS
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096
Investigation of local area networks for an orbiting space station N86-31417
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446

DATA BASES
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
Using SMF records in managing a CADAM system
[DE86-006408] N86-31252
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372
Engineering graphics data entry for space station data base N86-31425
Integration of an expert system into a user interface language demonstration N86-31432
Extensive air showers (HE-4) N86-31500

DATA LINKS
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262

DATA MANAGEMENT
Los Alamos software development tools
[DE86-006024] N86-31248
Defense acquisition management data system code translation manual fiscal year 1985
[AD-A165987] N86-31442

DATA PROCESSING
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Development of a pulse height analyzer
[DE86-700766] N86-31034
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Los Alamos software development tools
[DE86-006024] N86-31248
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446

DATA PROCESSING EQUIPMENT
Introduction to the CCM modular processor (version PROC01)
[PB86-188579] N86-31196
Abstractions for fault tolerance in distributed systems
[AD-A166549] N86-31242

DATA REDUCTION
CCM modular processor users' guide (version PROC01)
[PB86-187069] N86-31197
Package for solving large sparse systems of stiff ordinary differential equations
[DE86-009545] N86-31292

DATA SMOOTHING
Motion sensitive frame integration
[AD-D012291] N86-30917
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186

DATA SYSTEMS
Defense acquisition management data system code translation manual fiscal year 1985
[AD-A165987] N86-31442

DATA TRANSFER (COMPUTERS)
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257

DATA TRANSMISSION
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262

DECELERATION
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747

DECISION MAKING
Pilot interaction with automated airborne decision making systems
[NASA-CR-176986] N86-31218
Representation for closed form significance testing in VL1 N86-31219
A discrete control model of PLANT N86-31220
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166698] N86-31317

DECISION THEORY
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166698] N86-31317

DECOMPOSITION
Extreme point methods in the determination of the structure of a class of bivariate distributions and some applications to contingency tables
[AD-A167230] N86-31285

DEEP SPACE NETWORK
Coronal and interplanetary propagation, interplanetary acceleration, cosmic-ray observations by deep space network and anomalous component N86-31495

DEFECTS
Use of holographic Fringe Linearization Interferometry (FLI) for detection of defects
[AD-A166141] N86-31032
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385

DEFENSE PROGRAM
Information analysis centers in the Department of Defense
[AD-A167001] N86-31444
Directory of researches for human research and development projects
[AD-A167100] N86-31445
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

DEFLECTION
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049

DEFORMATION
Predicting bore deformations and launcher stresses in railguns
[DE86-008738] N86-30751
A new efficient approach to the formulation of mixed finite element models for structural analysis
[AD-A167340] N86-31077
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
The effects of strain heating in lithospheric stretching models N86-31163
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164

DELAMINATING
Delamination fracture toughness of composite spacecraft structures N86-30777
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures N86-30781

DELAY
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166786] N86-30940
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342

DENSE PLASMAS
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371

DENSITY (MASS/VOLUME)
Measurement and calculation of the density of natural gases N86-30969
Pressure and temperature measurements on natural gases along isochores in the technically important state ranging from 270 to 300 K and at pressures up to 60 bars N86-30970

DENSITY MEASUREMENT
Measurement and calculation of the density of natural gases N86-30969

DEPOSITION
Assessment of the application of the sputtering process to beryllium for hardening optical coatings
[DE86-006656] N86-30872
Acid deposition: A national problem
[DE86-007810] N86-31117
Chemical instrumentation for field studies of atmospheric wet deposition processes
[DE86-005255] N86-31175
Surface acoustic wave dust-deposition sensor
[DE86-001068] N86-31346
Superlattice optical bistability research
[AD-A167176] N86-31384
Grain growth phenomena in films: A Monte Carlo approach
[DE86-008755] N86-31397

DESIGN ANALYSIS
Low frequency design verification of large spacecraft structures N86-30696
Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-86-97316] N86-30925
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933
Laser techniques for arc jet plasma diagnostics: continuation of a feasibility and design study N86-31436

DESORPTION
Silica gel sorption properties under adiabatic conditions
[DE86-004439] N86-30831

DETECTION
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
Abstractions for fault tolerance in distributed systems
[AD-A166549] N86-31242
Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379

DIAGNOSIS
Modeling and diagnostics of combustion in spark-ignition engines
[DE86-008173] N86-30828

DIAMETERS
The size, shape, density, and albedo of Ceres from its occultation of BD+8 deg 471
[NASA-CR-177089] N86-31485

DIELECTRICS
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176989] N86-30891
An investigation of dielectric loaded ridged waveguide
[AD-A167269] N86-30913

DIESEL ENGINES
Experimental validation of diesel spray combustion
[DE86-007773] N86-30825
Vegetable oils as diesel fuels. Reduction of carbon fouling
[DE86-750610] N86-30886
Fuel component and heteroatom effects on deposits and wear
[AD-A166839] N86-31051
Zirconia to cast iron brazing for uncooled diesel engines
[DE86-008882] N86-31058

DIESEL FUELS
Vegetable oils as diesel fuels. Reduction of carbon fouling
[DE86-750610] N86-30886

DIFFERENCE EQUATIONS
Comparison of some time domain methods for structural system identification N86-30677
Propagators for general nonlinear equations
[DE86-010071] N86-31294

DIFFERENTIAL CALCULUS
Deterministic sensitivity theory for nonlinear systems: The forward and the adjoint method
[DE86-009512] N86-31318

DIFFERENTIAL EQUATIONS
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700605] N86-31287
Potential for parallelism in ordinary differential equations
[DE86-007594] N86-31288
Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007384] N86-31290
Package for solving large sparse systems of stiff ordinary differential equations
[DE86-009545] N86-31292
Effects of stiffness
[DE86-009559] N86-31293
The asymptotic expansion of the global error of the box scheme in a stiff case
[IR-251] N86-31302
Extrapolated midpoint rule for differential equations. Part 1: Expansion theorems
[IR-255-PT-1] N86-31303
Discrete approximation of eigenfunction expansions of self adjoint ordinary differential operators
[IR-263] N86-31304

DIFFERENTIAL GEOMETRY
On the product of homogeneous spaces
[IR-274] N86-31332

DIFFERENTIAL PRESSURE
Orifice plate and differential pressure measurement N86-30972
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Measurement of small pressure differences at a high static pressure --- gas flow N86-30977

DIFFERENTIAL PULSE CODE MODULATION
Receiver for digital radio broadcasting via satellite
[ESA-86-97313] N86-30922
Four-phase modems for a satellite channel: Demodulation via differential detection
[ESA-86-97390] N86-30927

DIFFUSERS
Flow measurements in a centrifugal diffusor test device
[AD-A166758] N86-31004

DIFFUSION
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Transport and relaxation processes in supercritical fluids
[DE86-008329] N86-31023

DIGITAL COMPUTERS
Application of Ada higher order language to guidance and control
[AGARD-LS-146] N86-30740

DIGITAL FILTERS
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912

DIGITAL SPACECRAFT TELEVISION
Development of a small Multifunctional Ground Station (MGS) for satellite communication on 11/14 GHz
[ESA-86-97314] N86-30923

DIGITAL SYSTEMS
A GaAs based digital serial communications system
[AD-A166060] N86-30900
Advanced architectures for digital signal processors
[AD-A166921] N86-30905
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166786] N86-30940
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053

DIMENSIONAL ANALYSIS
Transfinite classification of weakly-infinite dimensional spaces
[IR-276] N86-31306
Invariant arcs, Whitney levels, and Kelley continua
[IR-288] N86-31329

DIMENSIONAL STABILITY
High-stability telescope structures --- spaceborne telescopes N86-30773
Dimensional stability of CFRP tubes for space structures N86-30775

DIODES
One dimensional models for relativistic electron beam diode design
[AD-A165953] N86-30934
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938

DIPOLE ANTENNAS
Near-field vector potentials for thin dipole antennas
[AD-A166542] N86-30902

DIPOLES
AE monitoring instrumentation for high performance superconducting dipoles and quadrupoles, Phase 2
[DE86-007414] N86-31035

DIRECT POWER GENERATORS
Railguns powered by explosive driven flux compression generators
[DE86-008735] N86-30749

DIRECTION FINDING
Wild bearing analysis. EAAF (Extended Algorithm Analysis Family)
[NASA-CR-176985] N86-30930

DIRECTIONAL ANTENNAS
Intersatellite link design issues
[AD-A166761] N86-30904

DIRECTIVITY
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] N86-31341

DIRECTORIES
Directory of Transducer Users, seventh edition
[AD-A167162] N86-30757
Directory of researches for human research and development projects
[AD-A167100] N86-31445

DISCRETE FUNCTIONS
Development and evaluation of DOTTOR, a computer code to couple two-dimensional to three-dimensional discrete ordinates calculations
[DE86-010081] N86-31259
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31261

DISCRIMINANT ANALYSIS (STATISTICS)
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309

DISPERSING
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879

DISPERSIONS
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017

DISPLACEMENT
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072

DISPLAY DEVICES
Airborne navigation remote map reader evaluation
[AD-A166976] N86-30729
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
Interpreted multiprocess display control system
[DE86-008644] N86-31250
Engineering graphics data entry for space station data base N86-31425

DISSOCIATION
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346

DISTRIBUTED PARAMETER SYSTEMS
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314

DISTRIBUTED PROCESSING
Abstractions for fault tolerance in distributed systems
[AD-A166549] N86-31242
Optimal partitioning of random programs across two processors
[NASA-CR-178159] N86-31261
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447

DISTRIBUTION FUNCTIONS
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065

DOCUMENTS
Integrated library system at ORNL: LION
[DE86-009867] N86-31448

DOPED CRYSTALS
Growth of large GSGG crystals
[DE86-006700] N86-31391

DOPPLER EFFECT
A comparison of ADOS (African Doppler Survey) point positioning results from various softwares
[AD-A166840] N86-31095
Possible violations of the relativity theory
[DE86-700611] N86-31404

DOPPLER RADAR
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-188802] N86-31482

DRAG
Aerodynamic drag reduction tests on a box-shaped vehicle
[NASA-CR-176982] N86-30692
Drag of bodies of revolution in cavitating flow
[DE86-005171] N86-31016
Numerical predictions of railgun performance including the effects of ablation and arc drag
[DE86-008718] N86-31355

DRAG REDUCTION
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30695
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] N86-30999

DRAINAGE
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

DRIFT (INSTRUMENTATION)
CSTAR star catalogue development N86-31434

DROP SIZE
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30980

DUCTED BODIES
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30981

DUCTED FLOW
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-178947] N86-30731

DUCTILITY
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131

DUST
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
Surface acoustic wave dust-deposition sensor
[DE86-001068] N86-31345

DYE LASERS
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870

DYES
Dynamic aspects of the dye-sensitized photoconductivity of semiconductors
[DE86-007662] N86-31395

DYNAMIC CHARACTERISTICS
Dynamic aspects of the dye-sensitized photoconductivity of semiconductors
[DE86-007662] N86-31395

DYNAMIC LOADS
Dynamic response of random parameterized structures with random excitation
[DE86-007246] N86-31078

DYNAMIC PROGRAMMING
Solving multi-state variable dynamic programming models using vector processing
[AD-A166763] N86-31244

DYNAMIC RESPONSE
Structural optimization with constraints in dynamics --- spacecraft design N86-30658
Identification and dynamic condensation of physical system matrices using incomplete dynamic response data N86-30671
Dynamic response of random parametered structures with random excitation
[DE86-007246] N86-31078
Dynamic response moments of random parametered structures with random excitation
[DE86-004567] N86-31079
DYNAMIC STRUCTURAL ANALYSIS
The Second International Symposium on Aeroelasticity and Structural Dynamics
[DGLR-85-02] N86-30627
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft N86-30640
Flutter calculation by a new program N86-30645
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods N86-30646
Dynamic analysis of structures with flexible rotors --- aircraft engines N86-30664
Structural dynamic aspects of rotor nodal isolation --- helicopters N86-30665
Analytical finite elements N86-30666
Influence of axial force on random vibration response of a structure N86-30667
Determination of both complex characteristic structural values and normal mode parameters from harmonic excitation near resonance N86-30668
Identification and dynamic condensation of physical system matrices using incomplete dynamic response data N86-30671
Eigensolution identification of non self-adjoint mechanical structures N86-30674
Recent developments in the identification of non-linearity in modal testing N86-30675
Comparison of some time domain methods for structural system identification N86-30677
Analysis-test correlation of dynamic mathematical models --- spacecraft structures N86-30680
Test and analysis correlation for structural dynamic systems --- spacecraft structures N86-30682
Dynamic verification of very large space structures N86-30683
Reconstruction of forcing functions based on measured structural responses N86-30684
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30688
Significance and reliability of dynamic analysis methods demonstrated in the Instrument Pointing System project --- Space Shuttle payload N86-30689
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] N86-30700
Aircraft response to turbulence
[AGARD-R-738] N86-30739
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763
Analytical and experimental results of advanced composite stiffened panels under combined loads N86-30766
Design of bolted joints in composites
[AGARD-R-727] N86-31064
Dynamic response moments of random parametered structures with random excitation
[DE86-004567] N86-31079
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
DYNAMICAL SYSTEMS
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007384] N86-31290

E

EAR PROTECTORS
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] N86-30907
EARPHONES
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] N86-30907
EARTH (PLANET)
The DMA/GPS Earth orientation prediction service
[AD-A166830] N86-30713
Oceanic structures of the Earth and the North Depression of Mars: A comparison of the formation mechanisms N86-31144
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170
EARTH CRUST
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
Thermal-mechanical response to simple shear extension N86-31133
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Heat flow increase following the rise of mantle isotherms and crustal thinning N86-31140
The evolution of rifting process in the tectonic history of the Earth N86-31145
Lithospheric and crustal thinning N86-31147
Thermal control of the style of extensional tectonics N86-31148
Extensional tectonics on continents and the transport of heat and matter N86-31149
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151
Low-angle normal faulting and isostatic response in the Gulf of Suez: Evidence from seismic interpretation and geometric reconstruction N86-31152
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
Low-angle normal faults-low differential stress at mid crustal levels N86-31154
Late Precambrian aulacogens of the North China craton N86-31155
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162
The effects of strain heating in lithospheric stretching models N86-31163
EARTH MANTLE
Heat flow increase following the rise of mantle isotherms and crustal thinning N86-31140
The evolution of rifting process in the tectonic history of the Earth N86-31145
Late Precambrian aulacogens of the North China craton N86-31155
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
The effects of strain heating in lithospheric stretching models N86-31163
EARTH OBSERVATIONS (FROM SPACE)
Earth observing system. Data and information system. Volume 2A: Report of the EOS Data Panel
[NASA-TM-87777] N86-31094
EARTH ORBITS
The DMA/GPS Earth orientation prediction service
[AD-A166830] N86-30713
EARTH PLANETARY STRUCTURE
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170
EARTH RESOURCES
Earth observing system. Data and information system. Volume 2A: Report of the EOS Data Panel
[NASA-TM-87777] N86-31094
Phase A technical study summary report for a Tropical Earth Resources satellite (TERS)
[JTERS-84-07] N86-31097
Proposal to NIVR for a system definition study of a Tropical Earth Resources Satellite (TERS) --- Netherlands Agency for Aerospace Programs (NIVR)
[NTERS-84-11] N86-31098
EARTH SURFACE
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
ECHO SOUNDING
Activities report in applied physics
[ESA-SP-97387] N86-31459
ECOLOGY
Hierarchy theory and global change
[DE86-005154] N86-31190
ECONOMIC ANALYSIS
Technical and economic assessments of electrochemical energy storage systems. Volume 1: Executive summary
[DE86-006855] N86-31102
EDGE LOADING
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075
EDUCATION
Ada (Trade name) curriculum. Basic Ada programming I202 teacher's guide. Laboratory manual and exercises
[AD-A166043] N86-31238
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 2
[AD-A166367] N86-31240
The Department of Defense statement on science in the mission agencies and federal laboratories before the Task Force on Science Policy of the Committee on Science and Technology of the United States House of Representatives, 99th Congress, first session
[AD-A166041] N86-31438
EFFERENT NERVOUS SYSTEMS
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
EGYPT
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129
Low-angle normal faulting and isostatic response in the Gulf of Suez: Evidence from seismic interpretation and geometric reconstruction N86-31152
EIGENVALUES
Simultaneous determination of normal eigenmodes and generalized damping matrix from complex eigenmodes N86-30670
Eigensolution identification of non self-adjoint mechanical structures N86-30674
Signal processing using model selection methods
[AD-A167318] N86-30915
Fully parallel algorithm for the symmetric eigenvalue problem
[DE86-007553] N86-31254
EIGENVECTORS
Simultaneous determination of normal eigenmodes and generalized damping matrix from complex eigenmodes N86-30670
Discrete approximation of eigenfunction expansions of self adjoint ordinary differential operators
[IR-263] N86-31304
EISCAT RADAR SYSTEM (EUROPE)
Determination of the thermospheric neutral wind from incoherent scatter radar measurements
[KGI-186] N86-31178
EL NINO
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206
ELASTIC BODIES
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft N86-30640
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
ELASTIC PLATES
Structural inelasticity 2B: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
ELASTIC PROPERTIES
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080
ELASTIC WAVES
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
ELASTODYNAMICS
Determination of both complex characteristic structural values and normal mode parameters from harmonic excitation near resonance N86-30668
ELASTOSTATICS
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
ELECTRIC ARCS
Diffuse discharge switch analysis
[AD-A167282] N86-30945
ELECTRIC BATTERIES
Technical and economic assessments of electrochemical energy storage systems. Volume 1: Executive summary
[DE86-006855] N86-31102

Wisconsin Electric and Hybrid Vehicle Demonstration Project
[DE86-009318] N86-31457
Electric vehicle traction battery module monitor test results for Wyle and Propel systems
[DE86-900543] N86-31458

ELECTRIC CONTACTS
In situ examination of segregation and wear processes of precious metal electrical contact alloys
[DE86-009089] N86-30954
Thermal and electrical contact conductance studies
[NASA-CR-177093] N86-31378
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-008791] N86-31398
SiPOS heterojunction contacts to silicon
[DE86-008879] N86-31399

ELECTRIC CURRENT
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367

ELECTRIC DIPOLES
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353

ELECTRIC DISCHARGES
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802

ELECTRIC FIELDS
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215

ELECTRIC MOMENTS
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353

ELECTRIC MOTOR VEHICLES
Research, development and demonstration of lead-acid batteries for electric vehicle propulsion
[DE86-008518] N86-31107
Wisconsin Electric and Hybrid Vehicle Demonstration Project
[DE86-009318] N86-31457
Electric vehicle traction battery module monitor test results for Wyle and Propel systems
[DE86-900543] N86-31458

ELECTRIC POTENTIAL
Gas mixture for triggerable spark gaps
[AD-D012289] N86-30946

ELECTRICAL ENGINEERING
Basic research in electronics (JSEP)
[AD-A166075] N86-30936

ELECTRICAL PROPERTIES
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396

ELECTRICAL RESISTIVITY
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939
Thermal and electrical contact conductance studies
[NASA-CR-177093] N86-31378

ELECTRO-OPTICS
Electro-optical development system
[AD-A166546] N86-31360
European Science Notes, volume 40, number 5
[AD-A166882] N86-31455

ELECTROCATALYSTS
Bimetallic fuel cell catalysts
[DE86-009259] N86-31108

ELECTROCHEMICAL CELLS
Electrolyte for use in high energy lithium based rechargeable electrochemical cell and rechargeable electrochemical cell including the electrolyte
[AD-D012310] N86-31100

ELECTROCHEMICAL CORROSION
Model of crack electrochemistry
[DE86-009346] N86-30830
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871

ELECTROCHEMICAL OXIDATION
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835

ELECTROCHEMISTRY
Model of crack electrochemistry
[DE86-009346] N86-30830
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835
The variation of corrosion potential with time for coated metal surfaces
[NASA-TP-2636] N86-30837

ELECTRODE MATERIALS
Research, development and demonstration of lead-acid batteries for electric vehicle propulsion
[DE86-008518] N86-31107

ELECTRODES
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871

ELECTRODYNAMICS
Diffuse discharge switch analysis
[AD-A167282] N86-30945

ELECTROLUMINESCENCE
Theoretical and material studies on thin-film electroluminescent devices
[NASA-CR-177150] N86-30932

ELECTROLYSIS
Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430

ELECTROLYTES
Electrolyte for use in high energy lithium based rechargeable electrochemical cell and rechargeable electrochemical cell including the electrolyte
[AD-D012310] N86-31100
Fuel cell reactions in super acid electrolytes
[PB86-201084] N86-31114

ELECTROLYTIC CELLS
Electrolyte for use in high energy lithium based rechargeable electrochemical cell and rechargeable electrochemical cell including the electrolyte
[AD-D012310] N86-31100

ELECTROMAGNETIC ABSORPTION
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
The classical radiometer equation in a limited medium in which discrete particles absorb and scatter
[ESA-86-97315] N86-30924

ELECTROMAGNETIC FIELDS
Cerenkov radiation and electromagnetic pulse produced by electron beams traversing a finite path in air
[AD-A167058] N86-30911
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929
Unified model for gravity-electro-weak interactions
[DE86-700688] N86-31474

ELECTROMAGNETIC INTERACTIONS
Railguns powered by explosive driven flux compression generators
[DE86-008735] N86-30749

ELECTROMAGNETIC INTERFERENCE
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929

ELECTROMAGNETIC MEASUREMENT
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912

ELECTROMAGNETIC NOISE
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938

ELECTROMAGNETIC PROPULSION
Predicting bore deformations and launcher stresses in6 railguns
[DE86-008738] N86-30751

ELECTROMAGNETIC PULSES
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30708
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840
Cerenkov radiation and electromagnetic pulse produced by electron beams traversing a finite path in air
[AD-A167058] N86-30911

ELECTROMAGNETIC SCATTERING
Striation effect on HF signals
[AD-A167017] N86-30909

ELECTRON ACCELERATION
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520

ELECTRON BEAM WELDING
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878
Prediction of electron beam welding depth of penetration
[DE86-007837] N86-31057

ELECTRON BEAMS
Diffuse discharge switch analysis
[AD-A167282] N86-30945

ELECTRON BOMBARDMENT
One dimensional models for relativistic electron beam diode design
[AD-A165953] N86-30934

ELECTRON DENSITY (CONCENTRATION)
A magnetospheric critical velocity experiment: Particle results N86-31463

ELECTRON DENSITY PROFILES
Infrared airglow clutter
[AD-A166994] N86-31171

ELECTRON DIFFRACTION
Diffraction and microscopy studies of the structure of grain boundaries in Fe, Fe-base alloys and ceramic materials
[DE86-007983] N86-31393

ELECTRON IMPACT
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346

ELECTRON IRRADIATION
Physical processes associated with radiation-induced interface states
[AD-A167280] N86-31386

ELECTRON MICROSCOPY
Diffraction and microscopy studies of the structure of grain boundaries in Fe, Fe-base alloys and ceramic materials
[DE86-007983] N86-31393

ELECTRON MOBILITY
Semiconductor alloy theory
[AD-A167306] N86-31387

ELECTRON PARAMAGNETIC RESONANCE
Modification of point defects in quartz for device applications
[DE86-007988] N86-31394

ELECTRON PRECIPITATION
Studies of the aurorally-induced ultraviolet emissions on the nightside of Venus
[NASA-CR-177004] N86-31478

ELECTRON SPECTROSCOPY
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819

ELECTRON STATES
Laser spectroscopy of ozone
[AD-A166516] N86-30820

ELECTRON TRANSFER
Dynamic aspects of the dye-sensitized photoconductivity of semiconductors
[DE86-007662] N86-31395

ELECTRON TUNNELING
Theoretical and material studies on thin-film electroluminescent devices
[NASA-CR-177150] N86-30932

ELECTRON-ION RECOMBINATION
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371

ELECTRONIC EQUIPMENT
JPL preferred parts list: Reliable electronic components
[NASA-CR-176258] N86-30889
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385

ELECTRONIC EQUIPMENT TESTS
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957

ELECTRONIC WARFARE
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176987] N86-31308
ELECTRONS
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209
ELECTROPHYSICS
Basic research in electronics (JSEP)
[AD-A166075] N86-30936
ELECTROSLAG REFINING
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753
ELECTROSTATIC BONDING
Core level shifts in semiconductors: A study of the electrostatic model
[DE85-703224] N86-31402
ELECTROSTATIC CHARGE
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
Core level shifts in semiconductors: A study of the electrostatic model
[DE85-703224] N86-31402
ELECTROSTATIC PROBES
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
ELECTROSTATICS
Container for multichip hybrid package
[AD-D012308] N86-30947
A magnetospheric critical velocity experiment: Particle results N86-31463
ELEMENTARY PARTICLE INTERACTIONS
Induced Higgs couplings to neutral bosons in e+e- collisions
[USIP-85-08] N86-31351
Identification of neutral Higgs bosons in the DELPHI detector at LEP
[USIP-85-09] N86-31352
Topics on cosmic rays. Vol. 1: 60th anniversary of C.M.G. Lattes
[DE86-700674] N86-31523
ELEMENTARY PARTICLES
Field theory of strings. Effective action for massless fields
[DE86-900006] N86-31322
Activities of the Werner-Heisenberg Institute of Physics
[ISSN-0173-6256] N86-31350
Nineteenth International Cosmic Ray Conference. Conference papers: Invited rapporteur, highlight, miscellaneous, volume 9
[NASA-CP-2376-VOL-9] N86-31483
ELLIPSES
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31260
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176987] N86-31308
ELLIPSOMETERS
Effects of surface microroughness in ellipsometry
[DE86-006014] N86-31364
EMBEDDING
A primer for program managers: Embedded software acquisition
[AD-A166731] N86-31441
EMBRITTLEMENT
Effect of neutron irradiation on vanadium alloys
[DE86-009156] N86-30851
EMISSION SPECTRA
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] N86-30735
X-ray absorption spectroscopy
[DE86-006728] N86-30824
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Studies of radiative transfer in planetary atmospheres
[NASA-CR-176898] N86-31479
EMITTERS
Wild bearing analysis. EAAF (Extended Algorithm Analysis Family)
[NASA-CR-176985] N86-30930
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31260
ENERGETIC PARTICLES
Cosmic ray anisotropies at high energies N86-31518
Elemental abundances in coronating events N86-31521
ENERGY ABSORPTION
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
ENERGY BANDS
Semiconductor alloy theory
[AD-A167306] N86-31387
ENERGY CONVERSION
Development of an elastic-impulse power transmission for wind energy conversion systems
[DE86-900708] N86-31103
ENERGY CONVERSION EFFICIENCY
Development of an elastic-impulse power transmission for wind energy conversion systems
[DE86-900708] N86-31103
Proceedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31106
Development of a thin AGaAs solar cell
[DE86-009544] N86-31112
ENERGY DISSIPATION
The effects of strain heating in lithospheric stretching models N86-31163
ENERGY DISTRIBUTION
Extensive air showers (HE-4) N86-31500
Muons and neutrinos N86-31501
Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
ENERGY LEVELS
Development of low-energy X-ray spectrograph system
[AD-A166195] N86-31347
ENERGY POLICY
Activities report in applied physics
[ESA-86-97387] N86-31459
ENERGY SPECTRA
Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511
The cosmic ray spectrum above 10(17) eV N86-31512
ENERGY STORAGE
Development of an elastic-impulse power transmission for wind energy conversion systems
[DE86-900708] N86-31103
Development of a simulation code for a latent heat thermal energy storage system in a space station
[DE86-010070] N86-31113
ENERGY TECHNOLOGY
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
ENERGY TRANSFER
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-006140] N86-30825
ENGINE AIRFRAME INTEGRATION
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] N86-30697
ENGINE PARTS
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
ENGINE TESTS
Needs assessment for nondestructive testing and materials characterization for improved reliability in structural ceramics for heat engines
[DE86-010039] N86-30881
ENGINEERING DRAWINGS
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257
Automation of review/approval cycle of MCAUTO CAD/CAM generated drawings and documents N86-31429
ENGINEERING MANAGEMENT
Hampton University/American Society for Engineering Education/NASA Summer Faculty Fellowship Program 1986
[NASA-CR-178169] N86-31437
ENGINES
Needs assessment for nondestructive testing and materials characterization for improved reliability in structural ceramics for heat engines
[DE86-010039] N86-30881
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060
ENTHALPY
A new method for the determination of stationary mass flow rates of gases N86-30982
ENVIRONMENT POLLUTION
Acid deposition: A national problem
[DE86-007810] N86-31117
Developments and trends in environmental protection
[OEFZS-4342] N86-31118
ENVIRONMENT PROTECTION
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
Developments and trends in environmental protection
[OEFZS-4342] N86-31118
Department of Housing and Urban Development-Independent Agencies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449
ENVIRONMENTAL CONTROL
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053
ENVIRONMENTAL MONITORING
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] N86-30715
ENVIRONMENTAL TESTS
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957
ENVIRONMENTS
Computer-aided fabrication system implementation
[AD-A166787] N86-31245
EPITAXY
Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388
EPOXY MATRIX COMPOSITES
Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems — spaceborne telescopes N86-30795
EPOXY RESINS
Hygrothermal characteristics of antenna materials — spacecraft antennas N86-30780
EQUATIONS OF MOTION
Flutter calculation by a new program N86-30645
Computational fluid dynamics, introduction N86-30994
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
Integrated gradients: A derivation of some difference forms for the equation of motion for compressible flow in two-dimensional Lagrangian hydrodynamics, using integration of pressures over surfaces
[DE86-008325] N86-31020
EQUATIONS OF STATE
Structure of the equation of state of real gases and liquids
[PTB-ME-69] N86-30832
EQUIPMENT SPECIFICATIONS
Specification of a NAVSTAR Global Positioning System (GPS) receiver for a differential GPS ground system
[NASA-CR-177073] N86-30710
Launcher barrel for the lethality test system railgun
[DE86-008739] N86-30750
Experimental measurement of ablation effects in plasma armature railguns
[DE86-008740] N86-30960
High accuracy fuel flowmeter
[NASA-CR-174869] N86-31030
Robot-assisted torque measurement
[DE86-009129] N86-31061
EQUIVALENT CIRCUITS
SIPOS heterojunction contacts to silicon
[DE86-008879] N86-31399
ERGODIC PROCESS
On generic points in the Cartesian square of Chacon's transformation
[IR-244] N86-31300
EROSION
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
ERROR ANALYSIS
Wild bearing analysis. EAAF (Extended Algorithm Analysis Family)
[NASA-CR-176985] N86-30930
Impact of the human on system safety analysis
[DE86-008182] N86-31224

ERRORS
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801
ERYTHROCYTES
Induced erythrocythemia and maximal aerobic power: An examination of modifying factors
[AD-A166522] N86-31212
ESTIMATES
Phase comparison time delay estimation using wideband signals
[AD-A167025] N86-30910
Bootstrapping nonlinear least squares estimates in the kalman filter model
[AD-A167099] N86-31311
ESTIMATORS
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] N86-30732
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31265
ETHYLENE
Transport and relaxation processes in supercritical fluids
[DE86-008329] N86-31023
EULER EQUATIONS OF MOTION
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] N86-30697
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Efficient solution methods for the Navier-Stokes equations N86-30994
Multigrid convergence acceleration techniques for explicit Euler solvers and applications to Navier-Stokes calculations N86-30997
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
EULER-LAGRANGE EQUATION
Derivation of the equations of conservation of mass, momentum and energy of compressible fluid mech anics in both Lagrangian and Eulerian forms from an integral viewpoint
[DE86-007210] N86-31026
EUROPEAN COMMUNICATIONS SATELLITE
Receiver for digital radio broadcasting via satellite
[ESA-86-97313] N86-30922
Four-phase modems for a satellite channel: Demodulation via differential detection
[ESA-86-97390] N86-30927
EUROPEAN SPACE AGENCY
A step towards an ESA composites design handbook for space structure applications N86-30799
EUROPEAN SPACE PROGRAMS
The X-SAR science plan — SIR-C
[DFVLR-MITT-85-17] N86-31084
EVALUATION
Measurement of small pressure differences at a high static pressure — gas flow N86-30977
EVAPORATION
Assessment of the application of the sputtering process to beryllium for hardening optical coatings
[DE86-006656] N86-30872
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750845] N86-31015
EXCIMER LASERS
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167087] N86-31040
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048
EXCIMERS
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167087] N86-31040
EXCITATION
Transient excitation of anharmonic adspecies by pulsed laser radiation
[AD-A166308] N86-31038
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
Studies of highly excited atoms
[AD-A166838] N86-31348
EXCRETION
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421
EXHAUST GASES
International Aviation (selected articles)
[AD-A166748] N86-30690
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
Engine heating device
[DE86-005095] N86-31055
EXHAUST NOZZLES
International Aviation (selected articles)
[AD-A166748] N86-30690
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
EXPECTATION
The Azema-Yor stopping time and ultimateness
[IR-273] N86-31331
EXPERIMENT DESIGN
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] N86-30702
Identification of neutral Higgs bosons in the DELPHI detector at LEP
[USIP-85-09] N86-31352
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447
EXPERT SYSTEMS
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
Real-time production system for intelligent robot control
[DE86-008501] N86-31271
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
Design criteria for expert systems N86-31411
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
EXPLOSIONS
Bistatic phase sounding in the ionosphere above the Minor Scale explosion
[DE86-008582] N86-31176
EXPLOSIVE DEVICES
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30888
EXPLOSIVES
Railguns powered by explosive driven flux compression generators
[DE86-008735] N86-30749
Chemistry Research Resource
[DE86-008765] N86-30811
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-006140] N86-30825
EXTERNAL COMBUSTION ENGINES
Evaluation of a Stirling engine heater bypass with the NASA Lewis nodal-analysis performance code
[NASA-CR-179460] N86-31452
EXTERNAL STORE SEPARATION
International Aviation (selected articles)
[AD-A166748] N86-30690
Store separation flight testing
[AGARD-AG-300-VOL-5] N86-30727
EXTERNAL STORES
A review of aeroelastic research at the Flight Dynamics Laboratory N86-30642
Rapid vibration mode analysis of aircraft with external stores N86-30679
EXTINGUISHING
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30890
EXTRACTION
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342
EXTRAGALACTIC RADIO SOURCES
Extragalactic astronomy N86-31489
Gamma ray astronomy from satellites and balloons N86-31490
EXTRAPOLATION
The asymptotic expansion of the global error of the box scheme in a stiff case
[IR-251] N86-31302
Extrapolated midpoint rule for differential equations. Part 1: Expansion theorems
[IR-255-PT-1] N86-31303
EXTRATERRESTRIAL MATTER
Constraints on galaxy formation theories N86-31486
Cosmogenic nuclei N86-31488
EXTRAVEHICULAR ACTIVITY
Materials considerations in the design of a metal-hydride heat pump for an advanced extravehicular mobility unit N86-31427
EXTRAVEHICULAR MOBILITY UNITS
Materials considerations in the design of a metal-hydride heat pump for an advanced extravehicular mobility unit N86-31427
EXTREMELY LOW FREQUENCIES
Comparisons of 76Hz transverse and radial magnetic field strength components received in Connecticut
[AD-A166548] N86-30903
Connecticut ELF (Extremely Low Frequency) field-strength measurements, August to December 1977 and July to September 1978
[AD-A167344] N86-30916
EXTRUDING
Basic studies of submicron layers of Nb-Al
[DE86-006985] N86-31389

F

F-104 AIRCRAFT
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
F-106 AIRCRAFT
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
FABRICATION
Launcher barrel for the lethality test system railgun
[DE86-008739] N86-30750
FACULAE
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
FAILURE
Synchronizer failure in A/D converters
[AD-A166819] N86-30942
Abstractions for fault tolerance in distributed systems
[AD-A166549] N86-31242
FAILURE ANALYSIS
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
FAILURE MODES
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
Einstein's special relativity versus Lorentz's Aether theory
[DE86-700627] N86-31405
FANS
Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733
FAR INFRARED RADIATION
Studies of highly excited atoms
[AD-A166838] N86-31348
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466
FAR ULTRAVICLET RADIATION
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167087] N86-31040
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-188802] N86-31482
FARADAY EFFECT
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367
FAST NUCLEAR REACTORS
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual
[DE86-780411] N86-31024
FASTENERS
Improved magnetic particle inspection of small threaded fasteners
[DE86-009324] N86-31067
FATIGUE LIFE
Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076

FATIGUE TESTS
Fatigue and damage in fibre reinforced nylon
N86-30761

FAULT TOLERANCE
Abstractions for fault tolerance in distributed systems
[AD-A166549] N86-31242

FAULT TREES
Impact of the human on system safety analysis
[DE86-008182] N86-31224

FEASIBILITY ANALYSIS
The black box. Silence is silver, speech is golden
[ESA-86-97394] N86-30706
Velocity precision measurements using laser Doppler anemometry N86-30966
Practical experiences with High Pressure (HP) gas counters. Problems of operating calibration with HP
N86-30974
A new method for the determination of stationary mass flow rates of gases N86-30982
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] N86-31337
Laser techniques for arc jet plasma diagnostics; continuation of a feasibility and design study
N86-31435

FEDERAL BUDGETS
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440
Department of Housing and Urban Development-Independent Agecies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449
National Aeronautics and Space Administration
N86-31450

FEEDBACK
Preliminary study of the use of Laplace and momentum vectors in the determination of interplanetary low thrust trajectories
[ESA-CR(P)-2173] N86-30745
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267

FEEDBACK CONTROL
Control of large flexible systems by spatial modal input-distribution control
[AD-A166912] N86-30803
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31265

FERMI SURFACES
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819

FERROMAGNETIC FILMS
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840

FEYNMAN DIAGRAMS
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353

FIBER OPTICS
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] N86-30735
Analysis of a doubly coupled single fiber resonator
[AD-A166851] N86-31033
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367

FIBER REINFORCED COMPOSITES
Fatigue and damage in fibre reinforced nylon
N86-30761
Damping of composites N86-30764
The strength of bolted joints in Kevlar RP — reinforced plastic (RP) N86-30765
Orthotropic properties of layered fiber composites
N86-30766
Adequate fiber reinforced structural elements in load introduction area of fiber reinforced shells N86-30770
Damage zone fracture analysis of fibrous composites
N86-30778
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780
Nondestructive testing of fiber reinforced composites using X-ray fine structure procedures N86-30784
Fiber reinforced plastic cases for solid propellant motors N86-30793
Improved fiber-reinforced SiC composites fabricated by chemical vapor infiltration
[DE86-006539] N86-30814
Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839

FIELD STRENGTH
Comparisons of 78Hz transverse and radial magnetic field strength components received in Connecticut
[AD-A166548] N86-30903
Connecticut ELF (Extremely Low Frequency) field-strength measurements, August to December 1977 and July to September 1978
[AD-A167344] N86-30916

FIELD THEORY (ALGEBRA)
The Hasse-Witt matrix of a formal group
[IR-236] N86-31323

FIELD THEORY (PHYSICS)
Superconformal Lagrangian without the need to introduce constraints
[DE86-009006] N86-31291
Field theory of strings. Effective action from a massless fields
[DE86-900006] N86-31322
Obtaining the Einstein-Hilbert action from a superconformal theory
[DE86-009007] N86-31406
Concerning the transformation behavior of fields under the superconformal symmetries
[DE86-009008] N86-31407

FIGHTER AIRCRAFT
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] N86-30695
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] N86-30741

FILAMENT WINDING
Winding with thermoplastic polymers — spacecraft structures
[SNIAS-861-430-106] N86-30804

FILM CONDENSATION
Condensation heat transfer under a microgravity environment N86-31414

FINANCIAL MANAGEMENT
Department of Housing and Urban Development-Independent Agecies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449

FINE STRUCTURE
Nondestructive testing of fiber reinforced composites using X-ray fine structure procedures N86-30784

FINITE DIFFERENCE THEORY
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
A 3-D analysis of Maxwell's equations for cavities of arbitrary shape
[DE86-007883] N86-30919
Efficient solution methods for the Navier-Stokes equations N86-30994
Time integration and conjugate gradient methods for the incompressible Navier-Stokes equations
[DE86-007177] N86-31027

FINITE ELEMENT METHOD
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods N86-30646
Analytical finite elements N86-30666
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Introduction to Computational Fluid Dynamics
[VKI-LS-1986-01] N86-30983
The finite element method in fluid mechanics
N86-30986
The numerical solution of the Navier-Stokes equations for incompressible flows and the applicability of the stream function formulation of the Navier-Stokes equations
[AD-A166061] N86-31002
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual
[DE86-780411] N86-31024
Time integration and conjugate gradient methods for the incompressible Navier-Stokes equations
[DE86-007177] N86-31027
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
A new efficient approach to the formulation of mixed finite element models for structural analysis
[AD-A167340] N86-31077
The prospects for finite element analysis methods for structural qualification
[AGARD-R-736] N86-31083
Development and application of the P-version of the finite element method
[AD-A166056] N86-31279
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31395

FINITE VOLUME METHOD
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-178947] N86-30731

FINLAND
Wind energy in electric power production, preliminary study
[DE86-751566] N86-31108

FIRE EXTINGUISHERS
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30980

FIRES
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30980

FLAME PROPAGATION
Modeling and diagnostics of combustion in spark-ignition engines
[DE86-008173] N86-30826

FLAME TEMPERATURE
Computation of adiabatic flame temperatures and other thermodynamic quantities
[DE86-009386] N86-31408

FLARED BODIES
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166850] N86-31089

FLASH LAMPS
Optimized flashlamp pumping of disc amplifiers
[DE86-007121] N86-31043

FLAT PLATES
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166889] N86-30700
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model
[DE86-009639] N86-31110
Condensation heat transfer under a microgravity environment N86-31414

FLEXIBILITY
Flexure strength analysis of Los Alamos ceramic bodies Al-13, Al-18, and MgO-Y2O3
[DE86-008576] N86-31081

FLEXIBLE BODIES
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory N86-30661
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30901
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273

FLEXIBLE SPACECRAFT
Stiffness control of large space structures
N86-30852
Application of the LQG/LTR technique to robust controller synthesis for a large flexible space antenna
[NASA-TP-2560] N86-30900

FLEXIBLE WINGS
Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods N86-30639

FLIGHT CONTROL
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-178906] N86-30718
The integrated manual and automatic control of complex flight systems
[NASA-CR-176940] N86-30757

FLIGHT INSTRUMENTS
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
Novel reentry vehicle instrument: The photodiode
[DE86-006234] N86-30808

FLIGHT RECORDERS
The black box. Silence is silver, speech is golden
[ESA-86-97394] N86-30706

FLIGHT SIMULATORS
The integrated manual and automatic control of complex flight systems
[NASA-CR-176940] N86-30757

FLIGHT TESTS
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 N86-30644
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods N86-30646
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system [AD-A166886] N86-30700
Store separation flight testing [AGARD-AG-300-VOL-5] N86-30727
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft [NASA-CR-176999] N86-30736
The integrated manual and automatic control of complex flight systems [NASA-CR-176940] N86-30737
Novel reentry vehicle instrument: The photodiode [DE86-006234] N86-30808
Flight service evaluation of composite components on the Bell helicopter model 206L [NASA-CR-178148] N86-30812
Determination of antennae patterns and radar reflection characteristics of aircraft [AGARD-AG-300-VOL-4] N86-30831

FLIGHT TRAINING
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology [AD-A167348] N86-31456

FLOODS
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone [AD-A166782] N86-31204

FLOW CHARACTERISTICS
Experimental validation of diesel spray combustion [DE86-007773] N86-30828

FLOW CHARTS
A quantitative characterization of control flow context: Software measures for programming environments [AD-A166782] N86-31243

FLOW DISTRIBUTION
A numerical analysis for vertical gust field induced by gust generator N86-30637
Aerodynamics of engine-airframe interaction [NASA-CR-179657] N86-30697
Unsteady design-point flow phenomena in transonic compressors [NASA-CR-176879] N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor [AD-A166759] N86-30734
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries [AD-A167299] N86-30914
Simulation and modeling of homogeneous, compressed turbulence [NASA-CR-176939] N86-30958
Application of a low order panel method to complex three-dimensional internal flow problems [NASA-CR-179656] N86-31001
Flow measurements in a centrifugal diffusor test device [AD-A166758] N86-31004
Three-dimensional shock wave and turbulent boundary layer interactions [AD-A167086] N86-31010
Gas dynamics of laser exhaust external to spacecraft [AD-A167143] N86-31011
Bursts and pressure fluctuations in turbulent boundary layers [AD-A167186] N86-31012
Techniques for optical interferanemography [AD-A165950] N86-31359

FLOW EQUATIONS
Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] N86-30696
Aerodynamics of engine-airframe interaction [NASA-CR-179657] N86-30697
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach [NASA-CR-176947] N86-30731
Adaptive computational methods for SSME internal flow analysis [NASA-CR-178864] N86-30959
Computational fluid dynamics, introduction N86-30964
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings — conference [VKI-LS-1986-02] N86-30968
Governing equations — viscous flow in turbomachinery bladings N86-30969
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence [AD-A166922] N86-31007
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics [AD-A166960] N86-31009

FLOW GEOMETRY
One dimensional models for relativistic electron beam diode design [AD-A165963] N86-30934

FLOW MEASUREMENT
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
Problems of large gas flow measurements at high and low pressures — conference [PTB-ME-58] N86-30962
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
Flow rate measuring devices for gas flows N86-30964
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30965
European Ecoromic Community (EEC) test stand comparison — gas flow measurement N86-30967
Primary measurement — gas flow N86-30976
Bursts and pressure fluctuations in turbulent boundary layers [AD-A167186] N86-31012
High accuracy fuel flowmeter [NASA-CR-174886] N86-31030

FLOW THEORY
Computational fluid dynamics, introduction N86-30964

FLOW VELOCITY
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
Flow rate measuring devices for gas flows N86-30964
Behavior of turbine wheel gas counters at high pressures N86-30975
Observations of shock acceleration processes in the solar wind N86-31505

FLOW VISUALIZATION
Experimental validation of diesel spray combustion [DE86-007773] N86-30828
Techniques for optical interferanemography [AD-A165950] N86-31359

FLOWMETERS
Problems of large gas flow measurements at high and low pressures — conference [PTB-ME-58] N86-30962
Flow rate measuring devices for gas flows N86-30964
Influence of the form of the vortex bodies on the technical performance of a vortex meter N86-30978
Effects of previous disturbances on the meter factors of a vortex meter N86-30979
High accuracy fuel flowmeter [NASA-CR-174886] N86-31030

FLUID DYNAMICS
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics [AD-A166960] N86-31009

FLUID FILMS
Falling film flow characteristics of the direct absorption receiver [DE86-004432] N86-31111

FLUID FLOW
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels [DE86-700752] N86-31014
Acoustic damping for explicit calculations of fluid flow at low Mach number [DE86-007576] N86-31019
Remarks on the choice of a stiff ordinary differential equation solver for the solution of fluid flow problems [DE86-010080] N86-31028
Tritium gas transfer pump development [DE86-007164] N86-31056
Falling film flow characteristics of the direct absorption receiver [DE86-004432] N86-31111
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122

FLUID MECHANICS
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices [NASA-CR-4004] N86-30999
Equations of laminar and turbulent flows in general curvilinear coordinates [AD-A166837] N86-31006
Acoustic damping for explicit calculations of fluid flow at low Mach number [DE86-007576] N86-31019
Derivation of the equations of conservation of mass, momentum and energy of compressible fluid mech anics in both Lagrangian and Eulerian forms from an integral viewpoint [DE86-007210] N86-31026
Interactions between ocean surface waves and currents [AD-A166688] N86-31199

FLUORESCENCE
Laser spectroscopy of ozone [AD-A166516] N86-30820
Megajoule laser glass development [DE86-006731] N86-30874

FLUOROCARBONS
Design and chemical synthesis of iodine-containing molecules for application to solar-pumped I* lasers [NASA-CR-176854] N86-31037

FLUTTER
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques N86-30647
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression N86-30650

FLUTTER ANALYSIS
Application of transonic unsteady methods for calculation of flutter airloads N86-30630
Theoretical flutter investigations on a plane cascade in incompressible flow — axial flow compressors and turbines N86-30635
A review of aeroelastic research at the Flight Dynamics Laboratory N86-30642
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 N86-30644
Flutter calculation by a new program N86-30645

FLYING PLATFORMS
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results [AD-A166991] N86-30908

FOAMS
Stress relaxation of cellular silicone material: 1984 [DE86-009131] N86-30880
A study of methods to predict and measure the transmission of sound through the walls of light aircraft [NASA-CR-177147] N86-31335

FOCUSING
Development of low-energy X-ray spectrograph system [AD-A166195] N86-31347
Fresnel diffraction in an optical system with focusing [DE86-006044] N86-31363

FORCE DISTRIBUTION
Determination of force distributions in multi-point resonance testing using various direct methods N86-30673

FORCED CONVECTION
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual [DE86-780411] N86-31024

FORCED VIBRATION
Reconstruction of forcing functions based on measured structural responses N86-30684

FORECASTING
Bootstrapping nonlinear least squares estimates in the kalman filter model [AD-A167099] N86-31311

FORGING
Effect of manufacturing processes on structural allowables, phase 1 [AD-A166857] N86-30842

FORMULAS (MATHEMATICS)
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments [AD-A166886] N86-31468

FORTRAN
User guide for JAKEF, revision 1 [DE86-007554] N86-31255

FORWARD SCATTERING
Striation effect on HF signals [AD-A167017] N86-30909

FOULING
Vegetable oils as diesel fuels. Reduction of carbon fouling [DE86-750610] N86-30886
Fuel component and heteroatom effects on deposits and wear [AD-A166839] N86-31051

FOURIER ANALYSIS
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
Solutions of boundary value problems for the Tricomi-equation
[IR-247] N86-31301
FOURIER TRANSFORMATION
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176989] N86-30891
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
FRACTURE MECHANICS
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31082
European Science Notes, volume 40, number 5
[AD-A166682] N86-31455
FRACTURE STRENGTH
Delamination fracture toughness of composite spacecraft structures N86-30777
Damage zone fracture analysis of fibrous composites N86-30778
Pulsed laser and ion beam surface modification of sintered alpha-SiC
[DE86-008978] N86-30816
Flexure strength analysis of Los Alamos ceramic bodies Al-13, Al-18, and MgO-Y2O3
[DE86-008576] N86-31081
Rifting on Venus: Implications for lithospheric structure N86-31121
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
FRACTURING
Effect of surface corrosion on glass fracture
[DE86-008404] N86-30876
FRAGMENTS
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
FREE CONVECTION
Potassium natural convection loop HT4, operating report number 1
[OEFZS-4329] N86-30862
FREE ELECTRON LASERS
Estimated burst power requirements for selected SDI missions
[DE86-005436] N86-30955
Free-electron lasers for strategic defense: The benefits of scientific open scientific exchange
[DE86-008033] N86-31046
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
FREE FLOW
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30899
FREE RADICALS
Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379
FREQUENCY CONTROL
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926
FREQUENCY HOPPING
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908
FREQUENCY MODULATION
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908
Double sideband generation with serrodyne modulators
[AD-D012293] N86-30918
FREQUENCY SHIFT
Double sideband generation with serrodyne modulators
[AD-D012293] N86-30918
FRESNEL DIFFRACTION
Fresnel diffraction in an optical system with focusing
[DE86-006044] N86-31363
FRICTION
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050
FUEL CELLS
Bimetallic fuel cell catalysts
[DE86-009259] N86-31108
Fuel cell reactions in super acid electrolytes
[PB86-201084] N86-31114
FUEL CONSUMPTION
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
FUEL FLOW
Experimental validation of diesel spray combustion
[DE86-007773] N86-30828
FUEL INJECTION
Fuel component and heteroatom effects on deposits and wear
[AD-A166839] N86-31051
FUEL SPRAYS
Experimental validation of diesel spray combustion
[DE86-007773] N86-30828
FUEL TANKS
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] N86-30719
Liquid hydrogen fueled passenger aircraft
[AD-A166229] N86-30724
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
FUNCTIONS (MATHEMATICS)
Some continuity theorems in probability
[IR-257] N86-31315
FURLABLE ANTENNAS
Development of an antenna structure for a deployable offset antenna N86-30797
FUSION REACTORS
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372

G

GADOLINIUM
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381
Growth of large GSGG crystals
[DE86-006700] N86-31391
GALACTIC COSMIC RAYS
Cosmogenic nuclei N86-31488
Galactic cosmic ray composition N86-31492
Cosmic ray sources, acceleration and propagation N86-31493
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496
GALACTIC EVOLUTION
Constraints on galaxy formation theories N86-31486
GALACTIC NUCLEI
Extragalactic astronomy N86-31489
GALACTIC RADIATION
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466
Cosmic jets N86-31484
Gamma-ray line astrophysics N86-31485
Constraints on galaxy formation theories N86-31486
Gamma ray astronomy from satellites and balloons N86-31490
GALAXIES
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700669] N86-31471
Magnetic fields of cosmic bodies
[DE86-701119] N86-31476
Constraints on galaxy formation theories N86-31486
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
GALLIUM ARSENIDES
A GaAs based digital serial communications system
[AD-A166060] N86-30900
Proceedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31108
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
GALLIUM COMPOUNDS
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381
Growth of large GSGG crystals
[DE86-006700] N86-31391
GAME THEORY
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166698] N86-31317
GAMMA RAY ASTRONOMY
Gamma ray astronomy from satellites and balloons N86-31490
Extensive air showers (HE-4) N86-31500
Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503
Observational properties of cosmic gamma-ray bursts N86-31504
Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31508
GAMMA RAY BURSTS
Gamma-ray line astrophysics N86-31485
Gamma ray astronomy from satellites and balloons N86-31490
Observational properties of cosmic gamma-ray bursts N86-31504
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4800 mwe) N86-31509
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511
GAMMA RAY SPECTRA
Gamma-ray line astrophysics N86-31485
Gamma ray astronomy from satellites and balloons N86-31490
GAMMA RAYS
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957
Nineteenth International Cosmic Ray Conference. Conference papers: Invited rapporteur, highlight, miscellaneous, volume 9
[NASA-CP-2376-VOL-9] N86-31483
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
Particle acceleration by the sun N86-31494
Extensive air showers (HE-4) N86-31500
Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503
Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506
GANYMEDE
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
GARNETS
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381
Growth of large GSGG crystals
[DE86-006700] N86-31391
GAS CHROMATOGRAPHY
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
GAS DENSITY
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371
GAS DYNAMICS
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011

Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments N86-31454

GAS EXCHANGE
Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207

GAS FLOW
Problems of large gas flow measurements at high and low pressures — conference
[PTB-ME-58] N86-30962
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
Flow rate measuring devices for gas flows N86-30964
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30965
Velocity precision measurements using laser Doppler anemometry N86-30966
European Economic Community (EEC) test stand comparison — gas flow measurement N86-30967
Measurement of small pressure differences at a high static pressure — gas flow N86-30977
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017

GAS IONIZATION
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334

GAS LASERS
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041

GAS METERS
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
Accuracy of high pressure gas meter calibration in the Netherlands N86-30968
Orifice plate and differential pressure measurement N86-30972
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Practical experiences with High Pressure (HP) gas counters. Problems of operating calibration with HP N86-30974
Behavior of turbine wheel gas counters at high pressures N86-30975
Primary measurement — gas flow N86-30976
Vortex gas counter type WBZ 08. Practical experience N86-30980
The gas measuring bell: A basic normal equipment for the representation of volume unit for gases N86-30981

GAS MIXTURES
Gas mixture for triggerable spark gaps
[AD-D012289] N86-30946

GAS TUNGSTEN ARC WELDING
Calorimetry of pulsed versus continuous gas tungsten arc welds
[DE86-009285] N86-31062

GAS TURBINES
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

GAS-LIQUID INTERACTIONS
Falling film flow characteristics of the direct absorption receiver
[DE86-004432] N86-31111

GASES
Tritium gas transfer pump development
[DE86-007164] N86-31006

GATES (CIRCUITS)
Physical processes associated with radiation-induced interface states
[AD-A167280] N86-31386

GAUGE THEORY
Induced Higgs couplings to neutral bosons in e+e- collisions
[USIP-85-08] N86-31351
Unified model for gravity-electro-weak interactions
[DE86-700688] N86-31474

GAUSS EQUATION
Sieves for Gaussian processes
[AD-A166055] N86-31319

GEOCHRONOLOGY
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
A regional 17-18 MA thermal event in Southwestern Arizona N86-31126
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Thermal history of a metamorphic core complex N86-31132
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
Io: Mountains and crustal extension N86-31135
Cenozoic extension and magmatism in Arizona N86-31158
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

GEODESY
A comparison of ADOS (African Doppler Survey) point positioning results from various softwares
[AD-A166840] N86-31095

GEODETIC SATELLITES
A comparison of ADOS (African Doppler Survey) point positioning results from various softwares
[AD-A166840] N86-31095

GEODETIC SURVEYS
A comparison of ADOS (African Doppler Survey) point positioning results from various softwares
[AD-A166840] N86-31095
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201

GEOGRAPHIC INFORMATION SYSTEMS
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053

GEOGRAPHY
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096

GEOLOGICAL FAULTS
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31125
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen N86-31141
Hot-spot tectonics on Io N86-31142
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143
The evolution of rifting process in the tectonic history of the Earth N86-31145
Extensional tectonics of the Saturnian Satellites N86-31146
Thermal control of the style of extensional tectonics N86-31148
Extensional tectonics on continents and the transport of heat and matter N86-31149
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151
Low-angle normal faulting and isostatic response in the Gulf of Suez: Evidence from seismic interpretation and geometric reconstruction N86-31152
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
Low-angle normal faults-low differential stress at mid crustal levels N86-31154
Late Precambrian aulacogens of the North China craton N86-31155
Cenozoic extension and magmatism in Arizona N86-31158
A numerical study of forced lithospheric thinning N86-31159
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164

GEOLOGICAL SURVEYS
Geology — X-SAR/SIR-C mission N86-31086

GEOMAGNETISM
Observations of the Earth's magnetic field from the shuttle: Using the Spartan carrier as a magnetic survey tool
[NASA-TM-87796] N86-30755
Geopotential research mission, science, engineering and program summary
[NASA-TM-86240] N86-31093
Cenozoic extension and magmatism in Arizona N86-31158

GEOMETRY
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] N86-31237
Extremal digraphs without directed paths of length three or two
[MEMO-449] N86-31307

GEOMORPHOLOGY
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
Rifting on Venus: Implications for lithospheric structure N86-31121
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131

GEOPHYSICAL OBSERVATORIES
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241
Activities report of the Geophysical Institute
[ISSN-0283-1686] N86-31460

GEOPHYSICS
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
European Science Notes, volume 40, number 5
[AD-A166682] N86-31455

GEOPOTENTIAL
Geopotential research mission, science, engineering and program summary
[NASA-TM-86240] N86-31093

GEOSTROPHIC WIND
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31156

GEOTEMPERATURE
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157
The effects of strain heating in lithospheric stretching models N86-31163

GEOTHERMAL ANOMALIES
Lithospheric and crustal thinning N86-31147
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157

GERMANIUM
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-006791] N86-31398

GERMANIUM ALLOYS
Semiconductor alloy theory
[AD-A167308] N86-31387

GLASS
Effect of surface corrosion on glass fracture
[DE86-006404] N86-30876
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385

GLIDERS
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662
GLINT
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205
GLOBAL POSITIONING SYSTEM
Specification of a NAVSTAR Global Positioning System (GPS) receiver for a differential GPS ground system
[NASA-CR-177073] N86-30710
The DMA/GPS Earth orientation prediction service
[AD-A166830] N86-30713
GNEISS
Thermal history of a metamorphic core complex
N86-31132
GOLD
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
GOLD ALLOYS
In situ examination of segregation and wear processes of precious metal electrical contact alloys
[DE86-009089] N86-30954
GOVERNMENT PROCUREMENT
A primer for program managers: Embedded software acquisition
[AD-A166731] N86-31441
GOVERNMENT/INDUSTRY RELATIONS
Free-electron lasers for strategic defense: The benefits of scientific open scientific exchange
[DE86-008033] N86-31046
GRAIN BOUNDARIES
Grain boundary dislocation structures in 001 symmetric tilt boundaries in aluminum
[DE86-007003] N86-30846
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
Diffraction and microscopy studies of the structure of grain boundaries in Fe, Fe-base alloys and ceramic materials
[DE86-007983] N86-31393
Grain growth phenomena in films: A Monte Carlo approach
[DE86-008755] N86-31397
GRAIN SIZE
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
GRAND UNIFIED THEORY
Experimental and theoretical high energy physics
[DE86-009052] N86-31356
GRAPH THEORY
Synthesis of a self-timed controller for a successive-approximation A/D converter
[AD-A166788] N86-30941
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
Matching extension and the genus of a graph
[AD-A166562] N86-31282
Extremal digraphs without directed paths of length three or two
[MEMO-449] N86-31307
GRAPHITE-EPOXY COMPOSITES
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
GRAPHS (CHARTS)
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31166
Matching extension and the genus of a graph
[AD-A166562] N86-31282
GRAVITATION THEORY
Superconformal Lagrangian without the need to introduce constraints
[DE86-009006] N86-31291
Field theory of strings. Effective action for massless fields
[DE86-900006] N86-31322
Obtaining the Einstein-Hilbert action from a superconformal theory
[DE86-009007] N86-31406
Relativistic cosmologies with closed, locally homogeneous space sections
[DE86-700673] N86-31473
Unified model for gravity-electro-weak interactions
[DE86-700688] N86-31474
GRAVITATIONAL COLLAPSE
Homoclinic phenomena in the gravitational collapse
[DE86-700671] N86-31472
GRAVITATIONAL EFFECTS
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
GRAVITATIONAL FIELDS
Geopotential research mission, science, engineering and program summary
[NASA-TM-86240] N86-31093
Field theory of strings. Effective action for massless fields
[DE86-900006] N86-31322
Experiment to measure the gravitational force on the antiproton
[DE86-008725] N86-31349
GRAVITINOS
Effective potential in N=1, d=4 supergravity coupled to the Volkov-Akulov field
[DE86-700634] N86-31475
GRAVITY ANOMALIES
Lithospheric and crustal thinning N86-31147
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
GREEN'S FUNCTIONS
Theoretical models of single-element LTSA antenna elements N86-30892
GROUND CREWS
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] N86-30907
GROUND STATE
Laser spectroscopy of ozone
[AD-A166516] N86-30820
GROUND STATIONS
Specification of a NAVSTAR Global Positioning System (GPS) receiver for a differential GPS ground system
[NASA-CR-177073] N86-30710
Development of a small Multifunctional Ground Station (MGS) for satellite communication on 11/14 GHz
[ESA-86-97314] N86-30923
Ground based ozone measurements in an equatorial rainforest
[INPE-3858-PRE-922] N86-31115
GROUND TESTS
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125
N86-30644
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods N86-30646
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing N86-30669
Dynamic verification of very large space structures
N86-30683
Vibration qualification at the David Florida Laboratory --- spacecraft N86-30687
Modified US Army U-8F ground vibration test
[NASA-TM-86741] N86-30723
GROUND TRACKS
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
GROUND WATER
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939
GROUP THEORY
The Hesse-Witt matrix of a formal group
[IR-238] N86-31323
A separable normal topological group which is not Lindelöf
[IR-252] N86-31326
A Dowkes group
[IR-269] N86-31330
GRUMMAN AIRCRAFT
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
N86-30654
GULF OF MEXICO
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31125
GULFS
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129
GUN PROPELLANTS
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165969] N86-30884
GUST ALLEVIATORS
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model N86-30649
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory N86-30651
GUST LOADS
A numerical analysis for vertical gust field induced by gust generator N86-30637
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model N86-30649
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression N86-30650
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory N86-30651
GUSTS
Aircraft response to turbulence
[AGARD-R-738] N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-729] N86-30741

H

HADRONS
Emulsion chamber observations and interpretation (HE 3) N86-31499
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
HALF LIFE
The F meson
[USIP-86-01] N86-31354
HALIDES
Corrosion of SiC ceramics in synthetic combustion atmospheres containing halides
[DE86-006732] N86-30873
HALL EFFECT
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
HALLEY'S COMET
Studies of radiative transfer in planetary atmospheres
[NASA-CR-178898] N86-31479
HANDBOOKS
A step towards an ESA composites design handbook for space structure applications N86-30799
HARDWARE UTILIZATION LISTS
JPL preferred parts list: Reliable electronic components
[NASA-CR-176258] N86-30889
HARMONIC EXCITATION
Determination of both complex characteristic structural values and normal mode parameters from harmonic excitation near resonance N86-30668
HARMONIC GENERATIONS
Basic considerations on surface optical nonlinearities
[DE86-008378] N86-31365
HARMONICS
Transient excitation of anharmonic adspecies by pulsed laser radiation
[AD-A166308] N86-31038
HAZARDS
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053
HEAO 3
Lead, platinum and other heavy elements in the primary cosmic radiation: HEAO-3 results N86-31516
HEAT MEASUREMENT
Calorimetry of pulsed versus continuous gas tungsten arc welds
[DE86-009265] N86-31062
HEAT PUMPS
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750645] N86-31015
Gas-engine heat pump test procedures
[PB86-201662] N86-31063
Materials considerations in the design of a metal-hydride heat pump for an advanced extravehicular mobility unit
N86-31427
HEAT RESISTANT ALLOYS
Advances in the study of the mechanical behavior of materials
[AD-A164856] N86-30836
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
HEAT SOURCES
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136
HEAT STORAGE
Engine heating device
[DE86-005095] N86-31055
Numerical study of the performance of latent heat storage for solar dynamic power systems
[DE86-006748] N86-31104
Development of a simulation code for a latent heat thermal energy storage system in a space station
[DE86-010070] N86-31113

HEAT TRANSFER
Hydrogen storage system
[DE86-006990] N86-30887
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750845] N86-31015
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual
[DE86-780411] N86-31024
Calorimetry of pulsed versus continuous gas tungsten arc welds
[DE86-009285] N86-31062
Falling film flow characteristics of the direct absorption receiver
[DE86-004432] N86-31111
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Thermal-mechanical response to simple shear extension N86-31133
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Heat and detachment in core-complex extension N86-31139
Heat flow increase following the rise of mantle isotherms and crustal thinning N86-31140
Extensional tectonics on continents and the transport of heat and matter N86-31149
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 --- Space Stations and Their Environments
[NASA-CR-171931] N86-31409
HEAT TRANSFER COEFFICIENTS
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752
Condensation heat transfer under a microgravity environment N86-31414
An analysis of ullage heat transfer in the orbital refueling system N86-31424
HEAT TREATMENT
Study of settling of metallized sinter in reducing atmosphere
[BLL-M-36597-(5628.4)] N86-30836
HEATERS
Engine heating device
[DE86-005095] N86-31055
HEATING
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752
The effects of strain heating in lithospheric stretching models N86-31163
HEATING EQUIPMENT
Development of thermoelectric water heating-cooling devices
[AD-A166949] N86-31221
HEAVY IONS
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856
High energy nucleus-nucleus collisions N86-31513
HEAVY NUCLEI
Galactic cosmic ray composition N86-31492
Lead, platinum and other heavy elements in the primary cosmic radiation: HEAO-3 results N86-31516
HEIGHT
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
HELICOPTER DESIGN
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070
HELICOPTERS
Structural dynamic aspects of rotor nodal isolation --- helicopters N86-30665
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] N86-30612
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] N86-31337
HELIOSPHERE
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522
HELIOSTATS
System performance analysis of stretched membrane heliostats
[DE85-016885] N86-31101
HEMATOLOGY
Induced erythrocythemia and maximal aerobic power: An examination of modifying factors
[AD-A166522] N86-31212
HETEROJUNCTIONS
Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388
SIPOS heterojunction contacts to silicon
[DE86-008879] N86-31399
HIERARCHIES
Hierarchy theory and global change
[DE86-005154] N86-31190
HIGH ALTITUDE BALLOONS
Gamma ray astronomy from satellites and balloons N86-31490
HIGH ENERGY ELECTRONS
High energy electrons beyond 100 GEV observed by emulsion chamber N86-31519
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520
HIGH ENERGY INTERACTIONS
Experimental and theoretical high energy physics
[DE86-009052] N86-31356
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
Gamma-ray line astrophysics N86-31485
High energy interactions of cosmic ray particles N86-31498
Emulsion chamber observations and interpretation (HE 3) N86-31499
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503
Observational properties of cosmic gamma-ray bursts N86-31504
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4800 mwe) N86-31509
High energy nucleus-nucleus collisions N86-31513
HIGH FREQUENCIES
A Low-Data-Rate Voice Transmission System (LDRVTS) for HF communication
[AD-A166946] N86-30906
Striation effect on HF signals
[AD-A167017] N86-30909
HIGH LEVEL LANGUAGES
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 1
[AD-A166366] N86-31239
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 2
[AD-A166367] N86-31240
A guide to lexical acquisition in the JANUS system
[AD-A166078] N86-31443
HIGH POWER LASERS
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
HIGH PRESSURE
Using temperature-programmed reaction for kinetic analysis of reactions in dilute aqueous solutions at high pressure
[DE86-003653] N86-30827
Problems of large gas flow measurements at high and low pressures --- conference
[PTB-ME-58] N86-30962
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
Accuracy of high pressure gas meter calibration in the Netherlands N86-30968
Practical experiences with High Pressure (HP) gas counters. Problems of operating calibration with HP N86-30974
Behavior of turbine wheel gas counters at high pressures N86-30975
HIGH RESOLUTION
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31362
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-188802] N86-31482
HIGH REYNOLDS NUMBER
Numerical modeling of Navier-Stokes equations N86-30991
HIGH SPEED
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] N86-31338
HIGH STRENGTH STEELS
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166881] N86-31076
HIGH TEMPERATURE
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878
Review and analysis of high temperature chemical reactions and the effect of non-equilibrium conditions N86-31423
Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430
HIGH TEMPERATURE ENVIRONMENTS
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
HIGH TEMPERATURE GASES
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961
HIGH TEMPERATURE PLASMAS
Activities report of the Geophysical Institute
[ISSN-0283-1686] N86-31460
HILBERT SPACE
Deterministic sensitivity theory for nonlinear systems: The forward and the adjoint method
[DE86-009512] N86-31318
Convex Hilbert cubes in superextensions
[IR-254] N86-31327
HILBERT TRANSFORMATION
The Hopf algebra of symmetric functions
[IR-250] N86-31325
HISTORIES
Astronautics and aeronautics, 1977: A chronology
[NASA-SP-4022] N86-31524
HODOGRAPHS
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
HOLE DISTRIBUTION (ELECTRONICS)
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
HOLOGRAPHIC INTERFEROMETRY
Holographic interferometry for distortion measurements of antennas N86-30776
Holography: The nondestructive testing of composite structures
[SNIAS-861-430-103] N86-30817
Use of holographic Fringe Linearization Interferometry (FLI) for detection of defects
[AD-A166141] N86-31032
HOLOGRAPHY
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912
Space-variant optical systems
[AD-A167275] N86-31362
HOMOMORPHISMS
A Dowkes group
[IR-269] N86-31330
HOMOTOPY THEORY
Property C and fine homotopy equivalences
[IR-233] N86-31298
Invariant arcs, Whitney levels, and Kelley continua
[IR-268] N86-31329
HONEYCOMB CORES
Thermal stability of sandwich reflectors --- spacecraft antennas N86-30774
HONEYCOMB STRUCTURES
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
HOOP COLUMN ANTENNAS
Application of the LQG/LTR technique to robust controller synthesis for a large flexible space antenna
[NASA-TP-2560] N86-30800
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801

HOUSINGS
The development of the Ariane 4 SPELDA — Double-launch external structure (spelda) N86-30788
Ductless acoustical noise attenuator
[AD-D012268] N86-31344
HUMAN BEHAVIOR
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166698] N86-31317
HUMAN BEINGS
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215
HUMAN FACTORS ENGINEERING
Pilot interaction with automated airborne decision making systems
[NASA-CR-176986] N86-31218
A discrete control model of PLANT N86-31220
Making the human-machine interface responsive to many classes of users
[DE86-003453] N86-31222
Basic human factors considerations
[DE86-006181] N86-31223
Human factors management
[DE86-006184] N86-31226
Interpreted multiprocess display control system
[DE86-006844] N86-31250
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
Application of computer image enhancement techniques to shuttle hand-held photography N86-31416
Directory of researches for human research and development projects
[AD-A167100] N86-31445
HUMAN PERFORMANCE
Induced erythrocythemia and maximal aerobic power: An examination of modifying factors
[AD-A166522] N86-31212
Basic human factors considerations
[DE86-006181] N86-31223
Impact of the human on system safety analysis
[DE86-006182] N86-31224
Process of task analysis
[DE86-006183] N86-31225
Human factors management
[DE86-006184] N86-31226
Directory of researches for human research and development projects
[AD-A167100] N86-31445
HUMIDITY
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189
HURRICANES
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
Parameters determining maximum wind velocity in a tropical cyclone
[DE86-701371] N86-31193
HYDRAULIC EQUIPMENT
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060
HYDRAULIC FLUIDS
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060
HYDRAZINES
An analysis of ullage heat transfer in the orbital refueling system N86-31424
HYDROCARBON COMBUSTION
Sandia Cooperative Group on the aerothermochemistry of turbulent combustion
[DE86-006838] N86-30829
HYDROCARBONS
Fire control method and analytical model for large liquid hydrocarbon pool fires N86-31419
HYDRODYNAMICS
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
Numerical experiments with CONCHAS-SPRAY: Installation of the FLOE algorithm
[DE86-007575] N86-31018
Integrated gradients: A derivation of some difference forms for the equation of motion for compressible flow in two-dimensional Lagrangian hydrodynamics, using integration of pressures over surfaces
[DE86-006325] N86-31020
Development of a numerical procedure to map a general 3-d body onto a near-circle N86-31420
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-006715] N86-31477
HYDROGEN
Hydrogen storage system
[DE86-006990] N86-30687
HYDROGEN EMBRITTLEMENT
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843
HYDROGEN FUELS
Liquid hydrogen fueled passenger aircraft
[AD-A166229] N86-30724
HYDROGEN OXYGEN FUEL CELLS
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430
HYDROLOGY
Hydrology — X-SAR/SIR-C mission N86-31089
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204
HYDROPHONES
Problems in nonlinear acoustics: Parametric receiving arrays, focused finite amplitude sound and dispersive nonlinear interactions
[AD-A167311] N86-31343
HYDROXYL RADICALS
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
HYGRAL PROPERTIES
Hygrothermal characteristics of antenna materials — spacecraft antennas N86-30760
New prediction methods for composites hygrothermal behavior N86-30771
HYPERGEOMETRIC FUNCTIONS
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309
HYPERVELOCITY LAUNCHERS
Himass electromagnetic launcher at Los Alamos
[DE86-008734] N86-30748
Launcher barrel for the lethality test system railgun
[DE86-008739] N86-30750
Predicting bore deformations and launcher stresses in6 railguns
[DE86-008738] N86-30751
HYPOTHALAMUS
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
HYPOTHERMIA
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213

I

ICE
Ice and snow — X-SAR/SIC-C mission N86-31091
ICE FORMATION
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
ICE REPORTING
Ice and snow — X-SAR/SIC-C mission N86-31091
IGNEOUS ROCKS
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen N86-31141
IGNITERS
Evaluation of igniter compositions SR371C and SR44
[AD-A167007] N86-30810
IGNITION
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165969] N86-30884
ILLUMINANCE
Sky luminance and direct beam illuminance
[PB86-196755] N86-31180
ILLUSIONS
Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217
IMAGE ANALYSIS
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
IMAGE ENHANCEMENT
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
IMAGE INTENSIFIERS
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Electro-optical development system
[AD-A166546] N86-31380
IMAGE PROCESSING
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Motion sensitive frame integration
[AD-D012291] N86-30917
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358
IMMUNITY
Flow cytometry analysis of hormone receptors on human peripheral blood mononuclear cells to identify stress-induced neuroendocrine effects N86-31428
IMPACT LOADS
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] N86-30702
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
IMPACT STRENGTH
Crashworthiness of airframes
[AGARD-R-737] N86-30709
IMPACT TESTS
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
IMPEDANCE
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
IMPLOSIONS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334
IMPURITIES
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750679] N86-30848
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-008791] N86-31398
INCLUSIONS
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
INCOMPRESSIBLE FLOW
Theoretical flutter investigations on a plane cascade in incompressible flow — axial flow compressors and turbines N86-30635
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
The numerical solution of the Navier-Stokes equations for incompressible flows and the applicability of the stream function formulation of the Navier-Stokes equations
[AD-A166061] N86-31002
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
Stabilities of MHD rotational discontinuities
[DE85-703231] N86-31375
INCOMPRESSIBLE FLUIDS
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
INCONEL (TRADEMARK)
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753
INDEXES (DOCUMENTATION)
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453
INDEXES (RATIOS)
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208
INDUCTION HEATING
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753

INDUSTRIES
Spinoff 1985
[NASA-TM-89240] N86-31451
INELASTIC SCATTERING
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
INEQUALITIES
An inequality for stopped Brownian motion
[IR-227] N86-31297
INERTIAL CONFINEMENT FUSION
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334
INERTIAL FUSION (REACTOR)
Optimized flashlamp pumping of disc amplifiers
[DE86-007121] N86-31043
INFILTRATION
Improved fiber-reinforced SiC composites fabricated by chemical vapor infiltration
[DE86-008539] N86-30814
INFORMATION DISSEMINATION
Interpreted multiprocess display control system
[DE86-006844] N86-31250
Information analysis centers in the Department of Defense
[AD-A167001] N86-31444
INFORMATION FLOW
A discrete control model of PLANT N86-31220
INFORMATION RETRIEVAL
Integrated library system at ORNL: LION
[DE86-006857] N86-31448
INFORMATION SYSTEMS
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
Directory of researches for human research and development projects
[AD-A167100] N86-31445
INFORMATION THEORY
Signal processing using model selection methods
[AD-A167318] N86-30915
INFORMATION TRANSFER
Information analysis centers in the Department of Defense
[AD-A167001] N86-31444
INFRARED DETECTORS
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
Studies of highly excited atoms
[AD-A166838] N86-31348
INFRARED IMAGERY
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205
INFRARED LASERS
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
INFRARED RADIATION
Results of comparison studies of infrared radiative transfer models
[DE86-006531] N86-31191
Studies of highly excited atoms
[AD-A166838] N86-31348
INFRARED SPECTRA
Modification of point defects in quartz for device applications
[DE86-007988] N86-31394
INFRARED SPECTROSCOPY
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
INFRARED TELESCOPES
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357
INJECTION MOLDING
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879
INLET FLOW
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] N86-30697
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
INORGANIC CHEMISTRY
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
INPUT/OUTPUT ROUTINES
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 2
[AD-A166367] N86-31240
INSOLATION
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206
INSPECTION
Acoustic emission transient recording
[DE86-006908] N86-31066
Improved magnetic particle inspection of small threaded fasteners
[DE86-009324] N86-31067
INTAKE SYSTEMS
Ductless acoustical noise attenuator
[AD-D012288] N86-31344
INTEGRAL EQUATIONS
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30701
INTEGRATED CIRCUITS
A GaAs based digital serial communications system
[AD-A166060] N86-30900
Measurement of internal capacitances of integrated circuits
[DE86-006494] N86-30948
Testing, design and modeling issues in radiation-hardened CMOS integrated circuits
[DE86-007707] N86-30949
INTELLIGENCE
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176987] N86-31308
INTERFACE STABILITY
Monte Carlo stability analysis of strained layer superlattice interfaces
[DE86-007146] N86-31390
INTERFACES
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Intelligent interface for design and simulation
[DE86-000762] N86-31269
Physical processes associated with radiation-induced interface states
[AD-A167280] N86-31386
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
Integration of an expert system into a user interface language demonstration N86-31432
INTERFEROMETERS
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
INTERIM STAGES (SPACECRAFT)
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
INTERIOR BALLISTICS
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809
INTERNAL COMBUSTION ENGINES
Modeling and diagnostics of combustion in spark-ignition engines
[DE86-008173] N86-30826
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30958
Numerical experiments with CONCHAS-SPRAY: installation of the FLOE algorithm
[DE86-007575] N86-31018
Engine heating device
[DE86-005095] N86-31055
Gas-engine heat pump test procedures
[PB86-201662] N86-31063
INTERNAL CONVERSION
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
INTERPLANETARY MAGNETIC FIELDS
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
INTERPLANETARY TRAJECTORIES
Preliminary study of the use of Laplace and momentum vectors in the determination of interplanetary low thrust trajectories
[ESA-CR(P)-2173] N86-30745
INTERPROCESSOR COMMUNICATION
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262
INTERSTELLAR MAGNETIC FIELDS
Cosmic ray sources, acceleration and propagation N86-31493
INTERSTELLAR MATTER
Gamma-ray line astrophysics N86-31485
INVERSIONS
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
INVERTERS
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957
INVISCID FLOW
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
Implicit time dependent methods for inviscid and viscous compressible flows N86-30967
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics
[AD-A166960] N86-31009
IO
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Io: Mountains and crustal extension N86-31135
Hot-spot tectonics on Io N86-31142
IODINE COMPOUNDS
Design and chemical synthesis of iodine-containing molecules for application to solar-pumped I* lasers
[NASA-CR-176854] N86-31037
ION IRRADIATION
Pulsed laser and ion beam surface modification of sintered alpha-SiC
[DE86-008978] N86-30816
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856
IONIC COLLISIONS
High energy nucleus-nucleus collisions N86-31513
IONIC CRYSTALS
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
IONIZATION
Active plasma release experiments
[NASA-CR-176897] N86-31462
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments N86-31454
IONIZATION CHAMBERS
Void fraction measurement in two-phase flow with X-rays
[DE86-780422] N86-31025
IONIZATION POTENTIALS
A magnetospheric critical velocity experiment: Particle results N86-31463
Galactic cosmic ray composition N86-31492
IONOSPHERE
Infrared airglow clutter
[AD-A166994] N86-31171
Bistatic phase sounding in the ionosphere above the Minor Scale explosion
[DE86-008582] N86-31176
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
IONOSPHERIC DISTURBANCES
Infrared airglow clutter
[AD-A166994] N86-31171
IONOSPHERIC PROPAGATION
Striation effect on HF signals
[AD-A167017] N86-30909
IONOSPHERIC SOUNDING
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
IRON
Zirconia to cast iron brazing for uncooled diesel engines
[DE86-008982] N86-31058
IRON ALLOYS
Diffraction and microscopy studies of the structure of grain boundaries in Fe, Fe-base alloys and ceramic materials
[DE86-007983] N86-31393
IRON CHLORIDES
Study of the polarization for Incoloy 800 and for the stainless steel AISI 304 in mixtures of iron, nickel and chromium chlorides
[DE86-701576] N86-30858

ISOTHERMS
Heat flow increase following the rise of mantle isotherms and crustal thinning N86-31140
ITERATIVE SOLUTION
Simultaneous determination of normal eigenmodes and generalized damping matrix from complex eigenmodes N86-30870
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284

J

JAMMING
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30906
Methods for developing jam-resistant security communications networks at fixed-site facilities
[DE86-001321] N86-30920
JAPANESE SPACECRAFT
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
JET ENGINE FUELS
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] N86-30883
Fuel component and heteroatom effects on deposits and wear
[AD-A166839] N86-31051
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454
JET FLAPS
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
JET FLOW
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
JET PROPULSION
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454
JETTISONING
Store separation flight testing
[AGARD-AG-300-VOL-5] N86-30727
JOINTS (JUNCTIONS)
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
Design of bolted joints in composites
[AGARD-R-727] N86-31064
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071

K

KALMAN FILTERS
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31265
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
Bootstrapping nonlinear least squares estimates in the kalman filter model
[AD-A167099] N86-31311
KERNEL FUNCTIONS
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30701
KEROSENE
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] N86-30883
KEVLAR (TRADEMARK)
The strength of bolted joints in Kevlar RP --- reinforced plastic (RP) N86-30765
KINEMATICS
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
KINETIC ENERGY
Launcher barrel for the lethality test system railgun
[DE86-006739] N86-30750
A magnetospheric critical velocity experiment: Particle results N86-31463
KINETICS
Growth of large GSGG crystals
[DE86-006700] N86-31391
In-situ SAX investigations of isothermal crystallization in poly(TMPS) fractions
[DE86-003816] N86-31392
KLYSTRONS
Relativistic klystron
[DE86-009217] N86-30951

L

LAGOONS
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
LAGRANGE MULTIPLIERS
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
LAKES
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31126
LAMINAR BOUNDARY LAYER
Boundary layer equations and methods of solution N86-30985
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166650] N86-31003
LAMINAR FLOW
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] N86-30731
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006642] N86-31013
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172
LAMINATES
Orthotropic properties of layered fiber composites N86-30766
On the defect sensitivity of spacecraft typical thin CFRP laminates N86-30782
LAND USE
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
LANDFORMS
Extensional tectonics of the Saturnian Satellites N86-31146
LANDING GEAR
Simulation of aircraft taxi testing on the AGILE shaker test facility N86-30863
LANDSAT SATELLITES
Earth observing system. Data and information system. Volume 2A: Report of the EOS Data Panel
[NASA-TM-87777] N86-31094
LANGUAGES
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
The computational complexity of two-level morphology
[AD-A165991] N86-31266
LAP JOINTS
The strength of bolted joints in Kevlar RP --- reinforced plastic (RP) N86-30765
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071
LARGE SPACE STRUCTURES
Dynamic verification of very large space structures N86-30883
Low frequency design verification of large spacecraft structures N86-30886
Design and manufacturing aspects of space trusses N86-30772
Application of the LQG/LTR technique to robust controller synthesis for a large flexible space antenna
[NASA-TP-2560] N86-30800
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30891
LASER ANEMOMETERS
Techniques for optical interferanemography
[AD-A165950] N86-31359
European Science Notes, volume 40, number 5
[AD-A166682] N86-31456
LASER ANNEALING
Pulsed laser and ion beam surface modification of sintered alpha-SiC
[DE86-006978] N86-30918
LASER APPLICATIONS
Laser spectroscopy of ozone
[AD-A166516] N86-30820
Evaluation of factors affecting the analysis of metals using laser-induced breakdown spectroscopy
[DE86-008726] N86-30854
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209
Laser techniques for arc jet plasma diagnostics: continuation of a feasibility and design study N86-31425
LASER CAVITIES
Triple cavity laser
[AD-D012292] N86-31042
LASER DAMAGE
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31036
LASER DOPPLER VELOCIMETERS
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30985
Velocity precision measurements using laser Doppler anemometry N86-30986
First measurements with a laser Doppler anemometer in a high pressure natural gas pipe N86-30971
LASER GYROSCOPES
Analysis of a doubly coupled single fiber resonator
[AD-A166851] N86-31033
LASER HEATING
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
LASER INTERFEROMETRY
Use of holographic Fringe Linearization Interferometry (FLI) for detection of defects
[AD-A166141] N86-31032
Techniques for optical interferanemography
[AD-A165950] N86-31359
LASER MATERIALS
Megajoule laser glass development
[DE86-006731] N86-30874
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
LASER OUTPUTS
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870
Transient excitation of anharmonic adapecies by pulsed laser radiation
[AD-A166308] N86-31039
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048
LASER PLASMA INTERACTIONS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
LASER PUMPING
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167067] N86-31040
LASER RANGE FINDERS
Activities report in applied physics
[ESA-86-97387] N86-31458
LASER SPECTROSCOPY
Laser spectroscopy of ozone
[AD-A166516] N86-30820
Evaluation of factors affecting the analysis of metals using laser-induced breakdown spectroscopy
[DE86-008726] N86-30854
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209

LASER TARGET INTERACTIONS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
LASER TARGETS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
LASER WELDING
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878
LASERS
Optimized flashlamp pumping of disc amplifiers
[DE86-007121] N86-31043
Laboratory for Laser Energetics
[DE86-006834] N86-31044
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
Acoustic emission transient recording
[DE86-006906] N86-31066
LATENT HEAT
Numerical study of the performance of latent heat storage for solar dynamic power systems
[DE86-006748] N86-31104
LATERAL CONTROL
Tailoring methodology for aeroelastic stability and lateral control enhancement N86-30657
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30756
LATERAL STABILITY
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30756
LATITUDE
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31468
LATTICES (MATHEMATICS)
Binary convexities and distributive lattices
[R-225] N86-31296
LAUNCH VEHICLES
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790
LEAD (METAL)
Lead, platinum and other heavy elements in the primary cosmic radiation: HEAO-3 results N86-31516
LEAD ACID BATTERIES
Research, development and demonstration of lead-acid batteries for electric vehicle propulsion
[DE86-008518] N86-31107
LEADING EDGES
International Aviation (selected articles)
[AD-A166748] N86-30690
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698
LEARNING
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
LEAST SQUARES METHOD
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009083] N86-31256
Bootstrapping nonlinear least squares estimates in the kalman filter model
[AD-A167099] N86-31311
LEBESGUE THEOREM
An inequality for stopped Brownian motion
[R-227] N86-31297
LEGAL LIABILITY
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744
LEPTONS
Elementary particle physics N86-31487
LIBRARIES
Information analysis centers in the Department of Defense
[AD-A167001] N86-31444
Integrated library system at ORNL: LION
[DE86-008867] N86-31448
LIE GROUPS
Concerning the transformation behavior of fields under the superconformal symmetries
[DE86-009006] N86-31407
LIFE SUPPORT SYSTEMS
Defining reclaimed water potability requirements N86-31422
LIFT
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] N86-30999
LIFT AUGMENTATION
International Aviation (selected articles)
[AD-A166748] N86-30690
LIFT DEVICES
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field N86-30634
LIFTING BODIES
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field N86-30634
LIGHT (VISIBLE RADIATION)
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
LIGHT AMPLIFIERS
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
LIGHT SCATTERING
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172
LIGHTNING
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
LIGHTNING SUPPRESSION
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30708
LINE OF SIGHT COMMUNICATION
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
LINE SPECTRA
Evidence for a new intensity formula from standard tables of spectral line intensities — optical emission lines
[KGI-PREPRINT-085] N86-31369
Gamma-ray line astrophysics N86-31485
LINEAR ARRAYS
A linear array for Rayleigh scattering
[AD-A167109] N86-30622
LINEAR EQUATIONS
Optimum parameter identification in a dynamic system described by a stochastic linear differential equation with control functions
[ESA-86-97280] N86-31272
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700805] N86-31287
LINEAR FILTERS
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
Space-variant optical systems
[AD-A167275] N86-31362
LINEAR PREDICTION
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31281
LINEAR PROGRAMMING
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009083] N86-31256
LINEAR SYSTEMS
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31265
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
Parallel solution of linear systems with striped sparse matrices. Part 2. Stiffness matrices, A case study
[AD-A166047] N86-31278
Sequential and parallel matrix computations
[AD-A166062] N86-31320
LINEARIZATION
Use of holographic Fringe Linearization Interferometry (FLI) for detection of defects
[AD-A166141] N86-31032
LINGUISTICS
The computational complexity of two-level morphology
[AD-A165991] N86-31266
LIQUID CRYSTALS
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
Laboratory for Laser Energetics
[DE86-006834] N86-31044
LIQUID FUELS
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165969] N86-30884
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
Fire control method and analytical model for large liquid hydrocarbon pool fires N86-31419
LIQUID HYDROGEN
Liquid hydrogen fueled passenger aircraft
[AD-A166229] N86-30724
LIQUID ROCKET PROPELLANTS
An analysis of ullage heat transfer in the orbital refueling system N86-31424
LIQUIDS
Structure of the equation of state of real gases and liquids
[PTB-ME-69] N86-30832
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
LITHIUM ALLOYS
Theory of strengthening by ordered precipitates
[DE86-009355] N86-30861
LITHIUM CHLORIDES
Electrolyte for use in high energy lithium based rechargeable electrochemical cell and rechargeable electrochemical cell including the electrolyte
[AD-D012310] N86-31100
LITHOGRAPHY
Simple, compact, high brightness source for X-ray lithography and X-ray radiography
[DE86-009723] N86-30956
LITHOSPHERE
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
Io: Mountains and crustal extension N86-31135
Lithospheric and crustal thinning N86-31147
A numerical study of forced lithospheric thinning N86-31159
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
LOGIC CIRCUITS
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166786] N86-30940
Synthesis of a self-timed controller for a successive-approximation A/D converter
[AD-A166788] N86-30941
Automated reasoning: Basic research problems
[DE86-009214] N86-31270
LOGIC PROGRAMMING
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
Design criteria for expert systems N86-31411
LOGISTICS
Container for multichip hybrid package
[AD-D012306] N86-30947
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439

LOGISTICS MANAGEMENT
Rivista Tecnica Selenia, volume 9, number 4
[ESA-86-97244] N86-30894
An example of integrated logistic support applied also to production testing — aircraft industry N86-30896
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456
LONG DURATION SPACE FLIGHT
Analysis of nystagmus response to a pseudorandom velocity input N86-31426
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436
LONGITUDINAL STABILITY
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
LOOPS
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
LORENTZ CONTRACTION
Einstein's special relativity versus Lorentz's Aether theory
[DE86-700627] N86-31405
LORENTZ TRANSFORMATIONS
Einstein's special relativity versus Lorentz's Aether theory
[DE86-700627] N86-31405
Cosmic ray anisotropies at high energies N86-31518
LOSSY MEDIA
The classical radiometer equation in a limited medium in which discrete particles absorb and scatter
[ESA-86-97315] N86-30924
LOW FREQUENCIES
Connecticut ELF (Extremely Low Frequency) field-strength measurements, August to December 1977 and July to September 1978
[AD-A167344] N86-30916
LOW TEMPERATURE
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213
LOW TEMPERATURE ENVIRONMENTS
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060
LOW THRUST
Preliminary study of the use of Laplace and momentum vectors in the determination of interplanetary low thrust trajectories
[ESA-CR(P)-2173] N86-30745
LOW THRUST PROPULSION
Low-thrust rocket trajectories
[DE86-007573] N86-30754
LOWER ATMOSPHERE
DeWitt field study: Surface flux observations, in situ soundings and remote sensing of conditions affecting the behavior of the mixed layer over land
[DE86-008942] N86-31177
LUBRICANTS
Fuel component and heteroatom effects on deposits and wear
[AD-A166839] N86-31051
LUBRICATION
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454
LUMINANCE
Sky luminance and direct beam illuminance
[PB86-196755] N86-31180
LUMINOSITY
A study of the discrepant OSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
LUNAR CRUST
Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415
LUNAR EVOLUTION
Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415
LUNAR MARIA
Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415
LUNAR ROCKS
Chronology and isotopic geochemistry of apollo 14 basalts and Skaergard Gabbro, Eastern Greenland N86-31415
LUNAR SOIL
Mossbauer spectroscopy of extraterrestrial materials N86-31410
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421

M

MACHINE TOOLS
Robot-assisted torque measurement
[DE86-009129] N86-31061
MAGNETIC FIELDS
Comparisons of 76Hz transverse and radial magnetic field strength components received in Connecticut
[AD-A166548] N86-30903
Evaluation of the total magnetospheric energy output parameter, U/sub T/
[DE86-006017] N86-31173
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments N86-31464
Forbush decreases geomagnetic and atmospheric effects cosmogenic nuclides N86-31497
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
MAGNETIC PROPERTIES
Improved magnetic particle inspection of small threaded fasteners
[DE86-009324] N86-31067
MAGNETIC SHIELDING
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840
MAGNETIC SIGNATURES
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-168802] N86-31482
MAGNETIC STORMS
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31481
MAGNETIC SURVEYS
Observations of the Earth's magnetic field from the shuttle: Using the Spartan carrier as a magnetic survey tool
[NASA-TM-87796] N86-30755
MAGNETOHYDRODYNAMIC FLOW
Stabilities of MHD rotational discontinuities
[DE85-703231] N86-31375
MAGNETOHYDRODYNAMIC STABILITY
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-006564] N86-31374
Stabilities of MHD rotational discontinuities
[DE85-703231] N86-31375
Cosmic ray sources, acceleration and propagation N86-31493
MAGNETOSPHERE
Evaluation of the total magnetospheric energy output parameter, U/sub T/
[DE86-006017] N86-31173
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31481
Forbush decreases geomagnetic and atmospheric effects cosmogenic nuclides N86-31497
MAGNETOSPHERIC ION DENSITY
Activities report of the Geophysical Institute
[ISSN-0283-1686] N86-31480
MAGNETOSTATICS
Rivista Tecnica Selenia, volume 9, number 4
[ESA-86-97244] N86-30894
Magnetostatic wave application to microwave analog signal processing N86-30897
MAINTENANCE
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] N86-30715
MALES
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211
MALFUNCTIONS
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
Flow cytometry analysis of hormone receptors on human peripheral blood mononuclear cells to identify stress-induced neuroendocrine effects N86-31428
MAN MACHINE SYSTEMS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714
Pilot interaction with automated airborne decision making systems
[NASA-CR-176986] N86-31218
A discrete control model of PLANT N86-31220
Making the human-machine interface responsive to many classes of users
[DE86-003453] N86-31222
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
Interpreted multiprocess display control system
[DE86-006844] N86-31250
MANAGEMENT METHODS
Using SMF records in managing a CADAM system
[DE86-006408] N86-31252
MANAGEMENT PLANNING
Airport capacity enhancement plan
[AD-A166686] N86-30742
MANIFOLDS
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961
MANIPULATORS
Duty cycle testing and performance evaluation of the SM-229 teleoperator
[DE86-004780] N86-31059
MANNED SPACE FLIGHT
Analysis of nystagmus response to a pseudorandom velocity input N86-31426
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436
MANPOWER
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456
MANUALS
Ada (trade name) training curriculum. Basic Ada programming 1202 teacher's guide, volume 2
[AD-A166367] N86-31240
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
MANUFACTURING
Effect of manufacturing processes on structural allowables, phase 1
[AD-A166857] N86-30842
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
MAPPING
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939
MAPS
Airborne navigation remote map reader evaluation
[AD-A166976] N86-30729
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
MARINE ENVIRONMENTS
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
MARKETING
A study of factors related to commercial space platform services
[NASA-CR-176861] N86-30744
Spinoff 1985
[NASA-TM-89240] N86-31451
MARKOV PROCESSES
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31269
Martingales with given absolute value from the multiplicative decomposition of positive submartingales
[IR-224] N86-31295
Towards automatic Markov reliability modeling of computer architectures
[NASA-TM-89009] N86-31316
MARS (PLANET)
Oceanic structures of the Earth and the North Depression of Mars: A comparison of the formation mechanisms N86-31144

On the differences in continental rifting at the Earth, Mars and Venus N86-31150

MARS SURFACE SAMPLES
Mossbauer spectroscopy of extraterrestrial materials N86-31410

MARTENSITE
Microstructure and properties of ferrous alloy weldments
[DE86-008368] N86-30850

MARTINGALES
Martingales with given absolute value from the multiplicative decomposition of positive submartingales
[IR-224] N86-31295
On the construction of martingales with given absolute value, 2
[IR-241] N86-31299
The best bound in the L log L inequality of Hardy and Littlewood and its martingale counterpart
[IR-266] N86-31305

MASS
Effective potential in N=1, d=4 supergravity coupled to the Volkov-Akulov field
[DE86-700634] N86-31475

MASS DISTRIBUTION
Constraints on galaxy formation theories N86-31486

MASS FLOW RATE
A new method for the determination of stationary mass flow rates of gases N86-30982

MASS SPECTROMETERS
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823

MASS SPECTROSCOPY
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-008140] N86-30825
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045

MASS TRANSFER
A numerical study of forced lithospheric thinning N86-31159

MATCHING
Matching extension and the genus of a graph
[AD-A166562] N86-31282

MATERIALS HANDLING
Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30882
Container for multichip hybrid package
[AD-D012308] N86-30947
Interpreted multiprocess display control system
[DE86-008644] N86-31250

MATHEMATICAL LOGIC
Synthesis of a self-timed controller for a successive-approximation A/D converter
[AD-A166788] N86-30941

MATHEMATICAL MODELS
Advances in time domain modal identification and modeling of structures N86-30676
Updating mathematical models on the basis of vibration and modal test results, a review of experience N86-30681
Test and analysis correlation for structural dynamic systems --- spacecraft structures N86-30682
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
The integrated manual and atuomatic control of complex flight systems
[NASA-CR-176940] N86-30737
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30888
Theoretical models of single-element LTSA antenna elements N86-30892
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
Experimental measurement of ablation effects in plasma armature railguns
[DE86-008740] N86-30950
Turbulence models --- turbomachine bladings N86-30992
Performance of oil pumping rings: An analytical and experimental study
[NASA-CR-175083] N86-31000
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
Numerical experiments with CONCHAS-SPRAY: installation of the FLOE algorithm
[DE86-007575] N86-31018
Approximate analysis of the formation of a buoyant solid sphere in a supercooled melt
[DE86-007882] N86-31022
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
Prediction of electron beam welding depth of penetration
[DE86-007837] N86-31057
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
Results of comparison studies of infrared radiative transfer models
[DE86-006531] N86-31191
Physical interaction of humans and animals with power-frequency electric and magnetic fields
[DE86-007734] N86-31215
A discrete control model of PLANT N86-31220
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228
Fully parallel algorithm for the symmetric eigenvalue problem
[DE86-007553] N86-31254
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
On the coherence among the multitude of system identification methods N86-31275
Cellular automata method for phase unwrapping
[DE86-002124] N86-31289
Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007384] N86-31290
All subsets regression in Cox model
[AD-A166897] N86-31310
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166698] N86-31317
Vibration and structureborne noise in space station
[NASA-CR-177146] N86-31336
Basic considerations on surface optical nonlinearities
[DE86-008378] N86-31365
Global coordinates and exact aberration calculations applied to physical optics modeling of complex optical systems
[DE86-008751] N86-31366
Computer simulation of surface and film processes
[NASA-CR-176966] N86-31377
An IBM PC-based math model for space station solar array simulation N86-31418
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700669] N86-31471
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507

MATHEMATICAL PROGRAMMING
Proceedings of the 17th Symposium on the Interface of Computer Science and Statistics
[AD-A166019] N86-31228

MATRICES (MATHEMATICS)
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
The Hasse-Witt matrix of a formal group
[IR-238] N86-31323

MATRIX METHODS
Static aeroelastic analysis using aircraft vibration modes N86-30641
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing N86-30669
Determination of force distributions in multi-point resonance testing using various direct methods N86-30673

MATTER (PHYSICS)
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400

MAXWELL EQUATION
A 3-D analysis of Maxwell's equations for cavities of arbitrary shape
[DE86-007883] N86-30919

MEASURE AND INTEGRATION
On the construction of martingales with given absolute value, 2
[IR-241] N86-31299

MEASUREMENT
Research program with no measurement problem
[DE86-006952] N86-31403

MEASURING INSTRUMENTS
Directory of Transducer Users, seventh edition
[AD-A167162] N86-30757

MECHANICAL PROPERTIES
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753
Chemistry Research Resource
[DE86-008765] N86-30811
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
Effect of manufacturing processes on structural allowables, phase 1
[AD-A166857] N86-30842
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856
Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30882
Electro-optical development system
[AD-A166546] N86-31360

MEDITERRANEAN SEA
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205

MELTING
Megajoule laser glass development
[DE86-006731] N86-30874
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
A numerical study of forced lithospheric thinning N86-31159

MEMBRANES
System performance analysis of stretched membrane heliostats
[DE85-016885] N86-31101

MEMORY (COMPUTERS)
Active plasma release experiments
[NASA-CR-176897] N86-31462

MERCURY (METAL)
Sensitivity analysis of a numerically simulated HgCdTe solidification process by statistical methods
[DE86-007935] N86-30847

MERCURY CADMIUM TELLURIDES
Superlattice optical bistability research
[AD-A167176] N86-31384

MERCURY TELLURIDES
Superlattice optical bistability research
[AD-A167176] N86-31364

MESON-MESON INTERACTIONS
Unified model for gravity-electro-weak interactions
[DE86-700686] N86-31474

MESONS
Induced Higgs couplings to neutral bosons in e+e- collisions
[USIP-85-06] N86-31351
Identification of neutral Higgs bosons in the DELPHI detector at LEP
[USIP-85-09] N86-31352
The F meson
[USIP-86-01] N86-31354

MESOSCALE PHENOMENA
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166628] N86-31185

MESOSPHERE
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167

MESSAGE PROCESSING
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 2
[AD-A166352] N86-31231

METABOLISM
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211

METAL BONDING
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878

METAL CRYSTALS
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380

METAL FATIGUE
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855
METAL FILMS
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
METAL HYDRIDES
Materials considerations in the design of a metal-hydride heat pump for an advanced extravehicular mobility unit
N86-31427
METAL MATRIX COMPOSITES
Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839
METAL OXIDE SEMICONDUCTORS
A high-speed asynchronous communication technique for MOS (Metal-Oxide-Semiconductor) VLSI systems
[AD-A166846] N86-30943
METAL PARTICLES
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
METAL SURFACES
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871
METAL VAPORS
Potassium instrumentation and experiments on potassium vapor
[OEFZS-4328] N86-30834
Potassium natural convection loop HT4, operating report number 1
[OEFZS-4329] N86-30862
METALLOGRAPHY
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
METALS
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
Evaluation of factors affecting the analysis of metals using laser-induced breakdown spectroscopy
[DE86-008726] N86-30854
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
METAMORPHIC ROCKS
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
METAMORPHISM (GEOLOGY)
Thermal history of a metamorphic core complex
N86-31132
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
METASTABLE STATE
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
METEOR TRAILS
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
METEORITES
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31469
METEOROID SHOWERS
CSC meteor burst model enhancement test report
[AD-A165993] N86-30899
METEOROIDS
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31168
METEOROLOGICAL PARAMETERS
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
METEOROLOGICAL RADAR
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] N86-30707
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
METHOD OF CHARACTERISTICS
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
METRIC SPACE
Property C and fine homotopy equivalences
[IR-233] N86-31298
On generic points in the Cartesian square of Chacon's transformation
[IR-244] N86-31300
Transfinite classification of weakly-infinite dimensional spaces
[IR-276] N86-31306
Convex Hilbert cubes in superextensions
[IR-254] N86-31327
Function spaces of low Borel complexity
[IR-260] N86-31328
Relativistic cosmologies with closed, locally homogeneous space sections
[DE86-700673] N86-31473
METROLOGY
Metrological evaluation criteria for precision measurement of large gas flows N86-30963
MEXICO
Extent and character of early tertiary penetrative deformation, Sonora, Northwest Mexico N86-31120
MICROANALYSIS
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31469
MICROBIOLOGY
Advantages of the gas exchange approach to microbiological studies
[AD-A166887] N86-31207
MICROCHANNEL PLATES
Electro-optical development system
[AD-A166546] N86-31360
MICROHARDNESS
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856
MICROPROCESSORS
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
Development of a pulse height analyzer
[DE86-700768] N86-31034
Data flow accelerator module for general purpose processors
[DE86-008405] N86-31233
PASCAL for engineers: A course including OMEGASOF PASCAL for microcomputers
[DE86-701701] N86-31258
MICROSTRUCTURE
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Microstructure/Property relationships for carbon fiber reinforced aluminum alloys
[AD-A165992] N86-30839
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
Theory of strengthening by ordered precipitates
[DE86-009355] N86-30861
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396
Grain growth phenomena in films: A Monte Carlo approach
[DE86-008755] N86-31397
MICROWAVE ATTENUATION
The classical radiometer equation in a limited medium in which discrete particles absorb and scatter
[ESA-86-97315] N86-30924
MICROWAVE EQUIPMENT
Circular waveguide mode converters at 140 GHz
[DE86-009075] N86-30953
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
MICROWAVE LANDING SYSTEMS
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] N86-30715
MICROWAVE RADIOMETERS
The classical radiometer equation in a limited medium in which discrete particles absorb and scatter
[ESA-86-97315] N86-30924
MICROWAVE SCATTERING
The classical radiometer equation in a limited medium in which discrete particles absorb and scatter
[ESA-86-97315] N86-30924
MICROWAVES
Basic research in electronics (JSEP)
[AD-A166075] N86-30936
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214
Constraints on galaxy formation theories N86-31486
MILITARY AIR FACILITIES
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453
MILITARY HELICOPTERS
The black box. Silence is silver, speech is golden
[ESA-86-97394] N86-30706
MILITARY OPERATIONS
Directory of researches for human research and development projects
[AD-A167100] N86-31445
MILITARY TECHNOLOGY
Directory of researches for human research and development projects
[AD-A167100] N86-31445
MILKY WAY GALAXY
Cosmic jets N86-31484
Extragalactic astronomy N86-31489
Gamma ray astronomy from satellites and balloons
N86-31490
MILLIMETER-WAVES
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176989] N86-30891
Basic research in electronics (JSEP)
[AD-A166075] N86-30936
Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388
MINICOMPUTERS
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447
Integrated library system at ORNL: LION
[DE86-008867] N86-31448
MIRRORS
Assessment of the application of the sputtering process to beryllium for hardening optical coatings
[DE86-006656] N86-30872
System performance analysis of stretched membrane heliostats
[DE85-016885] N86-31101
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31369
MISSILE BODIES
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
MISSILE CONFIGURATIONS
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166850] N86-31003
MISSILE DEFENSE
Space power using solar photovoltaic panels: Costs and limitations
[DE86-008953] N86-31105
MISSILE TESTS
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
MISSILES
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454
MISSION PLANNING
The X-SAR science plan — SIR-C
[DFVLR-MITT-85-17] N86-31084
The X-SAR science team — SIR-C N86-31085
Geology — X-SAR/SIR-C mission N86-31088
Oceanography — X-SAR/SIR-C mission N86-31090

ice and snow — X-SAR/SIC-C mission N86-31091
Vegetation — X-SAR/SIR-C mission N86-31092

MIXING
Phase relations and miscibility in polymer blends containing copolymers
[AD-A166773] N86-30868
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879

MOBILITY
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053

MODAL RESPONSE
Static aeroelastic analysis using aircraft vibration modes N86-30641
Simultaneous determination of normal eigenmodes and generalized damping matrix from complex eigenmodes N86-30670
Modal parameters estimation from driven-base tests — spacecraft structures N86-30672
Recent developments in the identification of non-linearity in modal testing N86-30675
Advances in time domain modal identification and modeling of structures N86-30676
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique N86-30678
Updating mathematical models on the basis of vibration and modal test results, a review of experience N86-30681
Modified US Army U-8F ground vibration test
[NASA-TM-86741] N86-30723

MODE TRANSFORMERS
Circular waveguide mode converters at 140 GHz
[DE86-009075] N86-30953

MODEMS
Four-phase modems for a satellite channel: Demodulation via differential detection
[ESA-86-97390] N86-30927

MODULATION
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496

MODULATION TRANSFER FUNCTION
The determination of modulation transfer functions from the 'Noordwijk' radar measurements in 1978 and 1979 — offshore platform
[BCRS-85-02] N86-30921

MODULATORS
Double sideband generation with serrodyne modulators
[AD-D012293] N86-30918

MODULES
Double-stage air filter
[AD-D012307] N86-31054
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model
[DE86-009539] N86-31110
Introduction to the CCM modular processor (version PROC01)
[PB86-188679] N86-31196

MOIRE EFFECTS
Use of holographic Fringe Linearization Interferometry (FLI) for detection of defects
[AD-A166141] N86-31032

MOLECULAR BEAM EPITAXY
Superlattice optical bistability research
[AD-A167163] N86-31383
Superlattice optical bistability research
[AD-A167176] N86-31384

MOLECULAR BIOLOGY
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208

MOLECULAR COLLISIONS
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371

MOLECULAR IONS
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346

MOLECULAR STRUCTURE
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208

MOMENTS
Dynamic response moments of random parameterized structures with random excitation
[DE86-004567] N86-31079

MONITORS
AE monitoring instrumentation for high performance superconducting dipoles and quadrupoles, Phase 2
[DE86-007414] N86-31035

MONOMOLECULAR FILMS
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870

MONOPOLE ANTENNAS
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908

MONTE CARLO METHOD
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
Pilot interaction with automated airborne decision making systems
[NASA-CR-176986] N86-31218
Biased and unbiased cross-validation in density estimation
[AD-A166905] N86-31283
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
Computer simulation of surface and film processes
[NASA-CR-176966] N86-31377
Monte Carlo stability analysis of strained layer superlattice interfaces
[DE86-007146] N86-31390
Grain growth phenomena in films: A Monte Carlo approach
[DE86-006755] N86-31397

MORPHOLOGY
Descriptive characterization of solid ingredients
[AD-A166874] N86-30885
The computational complexity of two-level morphology
[AD-A165991] N86-31266

MOSSBAUER EFFECT
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
Mossbauer spectroscopy of extraterrestrial materials N86-31410

MOTION PERCEPTION
Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217

MOTION PICTURES
Motion sensitive frame integration
[AD-D012291] N86-30917

MOTION SICKNESS
Analysis of nystagmus response to a pseudorandom velocity input N86-31426

MOTOR VEHICLES
Aerodynamic drag reduction tests on a box-shaped vehicle
[NASA-CR-176982] N86-30692

MOUNTAINS
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
Io: Mountains and crustal extension N86-31135
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143

MOVING TARGET INDICATORS
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
Energy and Technology Review, June 1985
[DE85-014146] N86-31333

MULTI-ANODE MICROCHANNEL ARRAYS
Support of the balloon-borne ultraviolet stellar spectrograph
[NASA-CR-177152] N86-31031

MULTIPATH TRANSMISSION
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342

MULTIPROCESSING (COMPUTERS)
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912
Optimal partitioning of random programs across two processors
[NASA-CR-178159] N86-31261
Potential for parallelism in ordinary differential equations
[DE86-007594] N86-31268

MULTISENSOR APPLICATIONS
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728

MULTISTATIC RADAR
Rivista Tecnica Selenia, volume 9, number 4
[ESA-86-97244] N86-30894
Multistatic detection of radar signals for Swerling models of the target N86-30896

MULTIVARIATE STATISTICAL ANALYSIS
Signal processing using model selection methods
[AD-A167318] N86-30915

MUONS
Elementary particle physics N86-31487
Muons and neutrinos N86-31501
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31508
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4800 mwe) N86-31509
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511

MUSCLES
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213

MUSCULOSKELETAL SYSTEM
Flow cytometry analysis of hormone receptors on human peripheral blood mononuclear cells to identify stress-induced neuroendocrine effects N86-31428

N

N-TYPE SEMICONDUCTORS
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938

NAPHTHALENE
Transport and relaxation processes in supercritical fluids
[DE86-008329] N86-31023

NARROWBAND
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048

NASA PROGRAMS
The Association of Schools of Journalism and mass communication journalist-in-space project
[NASA-CR-176961] N86-30743
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744
Geopotential research mission, science, engineering and program summary
[NASA-TM-86240] N86-31093
Hampton University/American Society for Engineering Education/NASA Summer Faculty Fellowship Program 1986
[NASA-CR-178169] N86-31437
Department of Housing and Urban Development-Independent Agencies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449
Spinoff 1985
[NASA-TM-89240] N86-31451

NATIONAL SEVERE STORMS PROJECT
Severe local storm warning verification preliminary procedures
[PB86-194362] N86-31195

NATURAL GAS
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863
Measurement and calculation of the density of natural gases N86-30969
Pressure and temperature measurements on natural gases along isochores in the technically important state ranging from 270 to 300 K and at pressures up to 60 bars N86-30970
First measurements with a laser Doppler anemometer in a high pressure natural gas pipe N86-30971
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Computation of adiabatic flame temperatures and other thermodynamic quantities
[DE86-009386] N86-31406

NATURAL SATELLITES
Existence of undiscovered Uranian satellites
[DE86-006161] N86-31480

NAVIER-STOKES EQUATION
Sandia Cooperative Group on the sonothermochemistry of turbulent combustion
[DE86-006836] N86-30829
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30968

best copy available

Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961
Computational fluid dynamics, introduction N86-30984
Solution method of parabolized Navier-Stokes equations — turbomachine bladings N86-30990
Numerical modeling of Navier-Stokes equations N86-30991
Efficient solution methods for the Navier-Stokes equations N86-30994
Navier-Stokes computations for circulation controlled airfoils
[AIAA-85-1587] N86-30995
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] N86-30996
Multigrid convergence acceleration techniques for explicit Euler solvers and applications to Navier-Stokes calculations N86-30997
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998
The numerical solution of the Navier-Stokes equations for incompressible flows and the applicability of the stream function formulation of the Navier-Stokes equations
[AD-A166061] N86-31002
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166850] N86-31003
Numerical experiments with CONCHAS-SPRAY: installation of the FLOE algorithm
[DE86-007575] N86-31018
Time integration and conjugate gradient methods for the incompressible Navier-Stokes equations
[DE86-007177] N86-31027

NAVIGATION AIDS
The DMA/GPS Earth orientation prediction service
[AD-A166830] N86-30713
Airborne navigation remote map reader evaluation
[AD-A166976] N86-30729

NAVIGATION INSTRUMENTS
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] N86-30711

NAVIGATION SATELLITES
A comparison of ADOS (African Doppler Survey) point positioning results from various softwares
[AD-A166840] N86-31095

NEAR FIELDS
Near-field vector potentials for thin dipole antennas
[AD-A166542] N86-30902

NEODYMIUM
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875

NEODYMIUM LASERS
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870

NETHERLANDS
Evaluation of research: Experiences and perspectives in the Netherlands
[ESA-86-96709] N86-31461

NETWORK ANALYSIS
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264

NETWORK SYNTHESIS
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241

NEUROLOGY
European Science Notes, volume 40, number 5
[AD-A166882] N86-31455

NEUROMUSCULAR TRANSMISSION
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216

NEURONS
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216

NEUROPHYSIOLOGY
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216

NEUTRINOS
Muons and neutrinos N86-31501

NEUTRON EMISSION
Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31506

NEUTRON IRRADIATION
Effect of neutron irradiation on vanadium alloys
[DE86-009158] N86-30851

NEUTRON PHYSICS
Activities of the Werner-Heisenberg Institute of Physics
[ISSN-0173-6256] N86-31350

NEUTRON STARS
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503

NEUTRONS
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
Particle acceleration by the sun N86-31494

NEVADA
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124

NEW MEXICO
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136

NEWS MEDIA
The Association of Schools of Journalism and mass communication journalist-in-space project
[NASA-CR-176961] N86-30743

NICKEL
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855
Study of the polarization for Incoloy 800 and for the stainless steel AISI 304 in mixtures of iron, nickel and chromium chlorides
[DE86-701576] N86-30858

NICKEL ALLOYS
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-006005] N86-30852
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857

NICKEL STEELS
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376

NIGHTGLOW
Studies of the aurorally-induced ultraviolet emissions on the nightside of Venus
[NASA-CR-177004] N86-31478

NIOBIUM
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-006374] N86-31368

NIOBIUM ALLOYS
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-006005] N86-30852
Basic studies of submicron layers of Nb-Al
[DE86-006965] N86-31389

NITROGEN
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750679] N86-30848
Gas mixture for triggerable spark gaps
[AD-D012289] N86-30846

NITROGEN OXIDES
Acid deposition: A national problem
[DE86-007810] N86-31117
Chemical instrumentation for field studies of atmospheric wet deposition processes
[DE86-005255] N86-31175

NODES (STANDING WAVES)
Sensitivity analysis and optimization of nodal point placement for vibration reduction
[NASA-TM-87763] N86-31069

NOISE (SOUND)
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166961] N86-30907

NOISE INTENSITY
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937

NOISE POLLUTION
Activities report in applied physics
[ESA-86-97367] N86-31459

NOISE PREDICTION (AIRCRAFT)
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] N86-31338

NOISE PROPAGATION
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31335
Vibration and structureborne noise in space station
[NASA-CR-177146] N86-31336

NOISE REDUCTION
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31335
Ductless acoustical noise attenuator
[AD-D012288] N86-31344

NOISE THRESHOLD
Motion sensitive frame integration
[AD-D012291] N86-30917

NONDESTRUCTIVE TESTS
Integrity of carbon fiber reinforced plastics. Structural elements, screening procedures, opportunities and open issues — spacecraft structures N86-30780
Nondestructive testing of fiber reinforced composites using X-ray fine structure procedures N86-30784
Developments in the nondestructive evaluation (NDE) of composite materials N86-30785
Holography: The nondestructive testing of composite structures
[SNIAS-861-430-103] N86-30817
Needs assessment for nondestructive testing and materials characterization for improved reliability in structural ceramics for heat engines
[DE86-010039] N86-30891
Electronic simulator and calibrator for electrothermal response test systems
[DE86-006874] N86-30888
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31382
Laser techniques for arc jet plasma diagnostics; continuation of a feasibility and design study N86-31435

NONEQUILIBRIUM CONDITIONS
Review and analysis of high temperature chemical reactions and the effect of non-equilibrium conditions N86-31423

NONLINEAR EQUATIONS
Optimum acceleration factors for iterative solutions of linear and non-linear systems
[AD-A167171] N86-31284
Unique solution to a nonlinear ordinary differential equation
[DE86-005236] N86-31288
Propagators for general nonlinear equations
[DE86-010071] N86-31294

NONLINEAR SYSTEMS
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30889
Autonomous differential equations for the Henon map and other two-dimensional diffeomorphisms
[DE86-007364] N86-31290
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-008564] N86-31374

NONPARAMETRIC STATISTICS
Biased and unbiased cross-validation in density estimation
[AD-A166905] N86-31293

NONUNIFORM FLOW
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30791

NORMAL DENSITY FUNCTIONS
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31290
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314

NORTH AMERICA
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31135
Thermal control of the style of extensional tectonics N86-31140
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151

NOSE CONES
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166650] N86-31003
NOTCH SENSITIVITY
On the defect sensitivity of spacecraft typical thin CFRP laminates N86-30782
NOVA LASER SYSTEM
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
NOVAE
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477
NUCLEAR ELECTRIC POWER GENERATION
Estimated burst power requirements for selected SDI missions
[DE86-005438] N86-30955
NUCLEAR EMULSIONS
High energy electrons beyond 100 GEV observed by emulsion chamber N86-31519
NUCLEAR EXPLOSION EFFECT
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30706
NUCLEAR EXPLOSIONS
Estimated burst power requirements for selected SDI missions
[DE86-005438] N86-30955
NUCLEAR INTERACTIONS
High energy nucleus-nucleus collisions N86-31513
NUCLEAR MAGNETIC RESONANCE
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
Transport and relaxation processes in supercritical fluids
[DE86-008329] N86-31023
NUCLEAR PHYSICS
Activities of the Werner-Heisenberg Institute of Physics
[ISSN-0173-6256] N86-31350
NUCLEAR REACTIONS
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
NUCLEAR REACTORS
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007060] N86-31313
NUCLEAR WEAPONS
Estimated burst power requirements for selected SDI missions
[DE86-005438] N86-30955
NUCLEATION
Approximate analysis of the formation of a buoyant solid sphere in a supercooled melt
[DE86-007882] N86-31022
NUCLEI (NUCLEAR PHYSICS)
Cosmic jets N86-31484
Cosmogenic nuclei N86-31488
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
High energy interactions of cosmic ray particles N86-31498
High energy nucleus-nucleus collisions N86-31513
NUCLEON-NUCLEON INTERACTIONS
High energy interactions of cosmic ray particles N86-31498
NUCLEONS
Elementary particle physics N86-31487
NUMBER THEORY
Rivista Tecnica Selenia, volume 9, number 4
[ESA-88-97244] N86-30894
Number theory: A Proposal for high speed processors — radar signals N86-30895
NUMERICAL ANALYSIS
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
Remarks on the choice of a stiff ordinary differential equation solver for the solution of fluid flow problems
[DE86-010080] N86-31028
Summary of research in applied mathematics, numerical analysis, and computer sciences
[NASA-CR-178119] N86-31227
Propagators for general nonlinear equations
[DE86-010071] N86-31294
NUMERICAL CONTROL
Ultraviolet spectrometer and polarimeter (UVSP) software development and hardware tests for the solar maximum mission
[NASA-CR-177899] N86-30806
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358
NYLON (TRADEMARK)
Fatigue and damage in fibre reinforced nylon N86-30761

O

O RING SEALS
Performance of oil pumping rings: An analytical and experimental study
[NASA-CR-175083] N86-31000
OBJECT PROGRAMS
Design criteria for expert systems N86-31411
OCCULTATION
The size, shape, density, and albedo of Ceres from its occultation of BD+8 deg 471
[NASA-CR-177089] N86-31465
OCEAN CURRENTS
NASA Oceanic Processes Program
[NASA-TM-88987] N86-31198
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
OCEAN DYNAMICS
NASA Oceanic Processes Program
[NASA-TM-88987] N86-31198
OCEAN MODELS
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
OCEAN SURFACE
A model description for radar reflection on the sea surface 2
[ESA-88-97553] N86-30926
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31189
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
OCEANOGRAPHIC PARAMETERS
Oceanography — X-SAR/SIR-C mission N86-31090
OCEANOGRAPHY
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205
OCEANS
Oceanic structures of the Earth and the North Depression of Mars: A comparison of the formation mechanisms N86-31144
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166899] N86-31200
OFFSHORE PLATFORMS
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
OILS
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060
OKLAHOMA
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen N86-31141
OMEGA NAVIGATION SYSTEM
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] N86-30711
ON-LINE SYSTEMS
AE monitoring instrumentation for high performance superconducting dipoles and quadrupoles, Phase 2
[DE86-007414] N86-31035
Integrated library system at ORNL: LION
[DE86-006867] N86-31449
OPTICAL BISTABILITY
Superlattice optical bistability research
[AD-A167183] N86-31383
Superlattice optical bistability research
[AD-A167176] N86-31384
OPTICAL COMMUNICATION
Intersatellite link design issues
[AD-A166761] N86-30904
OPTICAL COUPLING
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
OPTICAL DATA PROCESSING
Space-variant optical systems
[AD-A167275] N86-31362
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments N86-31464
OPTICAL EMISSION SPECTROSCOPY
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
Evidence for a new intensity formula from standard tables of spectral line intensities — optical emission lines
[KGI-PREPRINT-085] N86-31369
OPTICAL EQUIPMENT
Multiaperture optics
[AD-A167060] N86-31361
OPTICAL FILTERS
Space-variant optical systems
[AD-A167275] N86-31362
OPTICAL MEASUREMENT
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
OPTICAL MEASURING INSTRUMENTS
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367
OPTICAL PATHS
Space-variant optical systems
[AD-A167275] N86-31362
OPTICAL PROPERTIES
Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30882
Electro-optical development system
[AD-A166546] N86-31360
Fresnel diffraction in an optical system with focusing
[DE86-006044] N86-31363
Basic considerations on surface optical nonlinearities
[DE86-006378] N86-31365
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385
Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388
Observational properties of cosmic gamma-ray bursts N86-31504
OPTICAL PUMPING
Optimized flashlamp pumping of disc amplifiers
[DE86-007121] N86-31043
OPTICAL RADAR
Theory and operation of the real-time data acquisition system for the NASA-LaRC differential absorption lidar (DIAL)
[NASA-CR-177151] N86-31036
OPTICAL REFLECTION
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
OPTICAL RESONANCE
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045
OPTICAL SCANNERS
Automated scanning of plastic nuclear track detectors using the Minnesota star scanner N86-31517
OPTIMAL CONTROL
The integrated manual and automatic control of complex flight systems
[NASA-CR-176940] N86-30737
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
OPTIMIZATION
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques N86-30647
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing N86-30654
Structural optimization programs and methods — aircraft weight reduction N86-30655
Variation of anisotropic behavior in structural optimization — aircraft composite structures N86-30658
Structural optimization with constraints in dynamics — spacecraft design N86-30658
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-725] N86-30741
Sensitivity analysis and optimization of nodal point placement for vibration reduction
[NASA-TM-87763] N86-31089

LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009083] N86-31256
Optimum parameter identification in a dynamic system described by a stochastic linear differential equation with control functions
[ESA-86-97260] N86-31272
CSTAR star catalogue development N86-31434

ORBIT TRANSFER VEHICLES
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31068

ORBITAL SERVICING
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
An analysis of ullage heat transfer in the orbital refueling system N86-31424

ORBITAL SPACE STATIONS
Space station automation study. Volume 1: Executive summary. Autonomous systems and assembly
[NASA-CR-176860] N86-30805
Space station molecular sieve development
[NASA-CR-178885] N86-30864
Development of a simulation code for a latent heat thermal energy storage system in a space station
[DE86-010070] N86-31113
Vibration and structureborne noise in space station
[NASA-CR-177146] N86-31336
National Aeronautics and Space Administration N86-31450

ORDER-DISORDER TRANSFORMATIONS
NMR study of disordered materials under extreme conditions of pressure and temperature
[AD-A167063] N86-30869
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376

ORGANIC COMPOUNDS
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
In vitro cytogenetic studies of organic chemicals found as contaminants in spacecraft cabin atmospheres N86-31433

ORIFICE FLOW
Orifice plate and differential pressure measurement N86-30972

ORION NEBULA
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466

ORTHOGONALITY
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006

ORTHOTROPISM
Orthotropic properties of layered fiber composites N86-30766

OSCILLATING FLOW
Calculation of three-dimensional transonic potential flows by a field panel method — oscillating wings N86-30629

OXIDATION
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-008005] N86-30652
Thermal and electrical contact conductance studies
[NASA-CR-177093] N86-31378

OXIDE FILMS
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385

OXIDES
Physical processes associated with radiation-induced interface states
[AD-A167280] N86-31386

OXYGEN
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750879] N86-30848
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30890
Infrared airglow clutter
[AD-A166994] N86-31171

OXYGEN BREATHING
The effect of breathing elevated CO2 gas mixtures on tracking performance, blood pressure, and subjective tolerance at 1Gz
[AD-A165974] N86-31210

OZONE
Ground based ozone measurements in an equatorial rainforest
[INPE-3858-PRE-922] N86-31115

P

P-TYPE SEMICONDUCTORS
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938

PACIFIC OCEAN
Typhoon structural variability
[AD-A166772] N86-31168
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201

PALLADIUM ALLOYS
In situ examination of segregation and wear processes of precious metal electrical contact alloys
[DE86-009089] N86-30954

PANEL FLUTTER
Recent results on the weight minimization of panels with a flutter speed constraint N86-30660

PANEL METHOD (FLUID DYNAMICS)
Calculation of three-dimensional transonic potential flows by a field panel method — oscillating wings N86-30629
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001

PANELS
Analytical and experimental results of advanced composite stiffened panels under combined loads N86-30766
Assessing the effects of delaminations on the postbuckling strength of CRFP panels — aircraft structures N86-30781

PARABOLIC DIFFERENTIAL EQUATIONS
Solution method of parabolized Navier-Stokes equations — turbomachine bladings N86-30990

PARABOLIC REFLECTORS
Structural analysis, manufacturing and test evaluation of a polarization sensitive reflector N86-30798

PARABOLOID MIRRORS
Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems — spaceborne telescopes N86-30795

PARALLEL FLOW
Silica gel sorption properties under adiabatic conditions
[DE86-004439] N86-30831

PARALLEL PROCESSING (COMPUTERS)
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912
Data flow accelerator module for general purpose processors
[DE86-008405] N86-31233
Hypercube algorithms and implementations
[DE86-007439] N86-31253
Fully parallel algorithm for the symmetric eigenvalue problem
[DE86-007553] N86-31254
Topological properties of interconnection networks for parallel processors. A unified approach, appendix E
[AD-A167336] N86-31263
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
Parallel solution of linear systems with striped sparse matrices. Part 2. Stiffness matrices, A case study
[AD-A166047] N86-31278
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
Potential for parallelism in ordinary differential equations
[DE86-007594] N86-31288
Sequential and parallel matrix computations
[AD-A166062] N86-31320

PARAMETER IDENTIFICATION
Modal parameters estimation from driven-base tests — spacecraft structures N86-30672
Eigensolution identification of non self-adjoint mechanical structures N86-30674
Recent developments in the identification of non-linearity in modal testing N86-30675
Comparison of some time domain methods for structural system identification N86-30677
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
Summary of research in applied mathematics, numerical analysis, and computer sciences
[NASA-CR-178119] N86-31227
Optimum parameter identification in a dynamic system described by a stochastic linear differential equation with control functions
[ESA-86-97260] N86-31272
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
System identification. Mini course
[ER-84/02] N86-31274
On the coherence among the multitude of system identification methods N86-31275
A generalized diagram for various parameter estimation methods; the coherence in pseudo-linear regression schemes N86-31276
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314

PARAMETERIZATION
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267

PARTIAL DIFFERENTIAL EQUATIONS
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30859
Remarks on the choice of a stiff ordinary differential equation solver for the solution of fluid flow problems
[DE86-010080] N86-31028
Parallel solution of linear systems with striped sparse matrices. Part 2. Stiffness matrices, A case study
[AD-A166047] N86-31278
Unique solution to a nonlinear ordinary differential equation
[DE86-005236] N86-31286

PARTICLE ACCELERATION
Cosmic ray sources, acceleration and propagation N86-31493
Particle acceleration by the sun N86-31494
Elemental abundances in corotating events N86-31521

PARTICLE ACCELERATORS
Elementary particle physics N86-31487

PARTICLE COLLISIONS
Studies of highly excited atoms
[AD-A166838] N86-31348
High energy interactions of cosmic ray particles N86-31498
High energy nucleus-nucleus collisions N86-31513

PARTICLE DENSITY (CONCENTRATION)
Extensive air showers (HE-4) N86-31500
The cosmic ray spectrum above 10(19) EV at Volcano Ranch and Haverah Park N86-31510
Measuring the energy spectrum of primary cosmic rays with the Yakutsk EAS array N86-31511
The cosmic ray spectrum above 10(17) eV N86-31512

PARTICLE EMISSION
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4600 mwe) N86-31509

PARTICLE INTERACTIONS
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371
Muons and neutrinos N86-31501

PARTICLE MASS
Field theory of strings. Effective action for massless fields
[DE86-900006] N86-31322
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353
The F meson
[USIP-86-01] N86-31354

PARTICLE PRODUCTION
High energy interactions of cosmic ray particles N86-31498
Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31508
High energy nucleus-nucleus collisions N86-31513

PARTICLE SIZE DISTRIBUTION
Descriptive characterization of solid ingredients
[AD-A166874] N86-30895

PARTICLE THEORY
Experimental and theoretical high energy physics
[DE86-009052] N86-31356
Research program with no measurement problem
[DE86-006952] N86-31403
PARTICLE TRACKS
Automated scanning of plastic nuclear track detectors using the Minnesota star scanner N86-31517
PARTICLES
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172
PARTITIONS (MATHEMATICS)
Optimal partitioning of random programs across two processors
[NASA-CR-178159] N86-31261
PASCAL (PROGRAMMING LANGUAGE)
PASCAL for engineers: A course including OMEGASOF PASCAL for microcomputers
[DE86-701701] N86-31258
PATTERN RECOGNITION
Multiaperture optics
[AD-A167060] N86-31361
PAYLOAD CONTROL
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
PAYLOAD MASS RATIO
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
PENETRATION
Prediction of electron beam welding depth of penetration
[DE86-007837] N86-31057
PERCEPTUAL ERRORS
Asymptotic distributions in parameterized functional relations
[MEMO-COSOR-84-09] N86-31314
PERFORMANCE PREDICTION
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357
PERFORMANCE TESTS
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] N86-30715
Himass electromagnetic launcher at Los Alamos
[DE86-008734] N86-30748
Railguns powered by explosive driven flux compression generators
[DE86-008735] N86-30749
An example of integrated logistic support applied also to production testing --- aircraft industry N86-30898
Influence of the form of the vortex bodies on the technical performance of a vortex meter N86-30978
Vortex gas counter type WBZ 08. Practical experience N86-30980
Duty cycle testing and performance evaluation of the SM-229 teleoperator
[DE86-004780] N86-31059
Gas-engine heat pump test procedures
[PB86-201662] N86-31063
System performance analysis of stretched membrane heliostats
[DE85-016885] N86-31101
Research, development and demonstration of lead-acid batteries for electric vehicle propulsion
[DE86-006518] N86-31107
Electric vehicle traction battery module monitor test results for Wyle and Propel systems
[DE86-900543] N86-31458
PERMEABILITY
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
PERMITTIVITY
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176989] N86-30891
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
PERSONNEL
Process of task analysis
[DE86-008183] N86-31225
Human factors management
[DE86-008184] N86-31226
PERSONNEL DEVELOPMENT
In-house CAD training: A realistic approach
[DE86-008926] N86-31251
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456
PERSONNEL MANAGEMENT
Human factors management
[DE86-008184] N86-31226
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456
PERSONNEL SELECTION
The Association of Schools of Journalism and mass communication journalist-in-space project
[NASA-CR-176961] N86-30743
PERTURBATION THEORY
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700605] N86-31287
Basic considerations on surface optical nonlinearities
[DE86-008378] N86-31365
Cosmic ray sources, acceleration and propagation N86-31493
PETROLOGY
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31469
PHARMACOLOGY
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208
PHASE CHANGE MATERIALS
Chemistry Research Resource
[DE86-008765] N86-30811
PHASE LOCKED SYSTEMS
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
PHASE MODULATION
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
PHASE SHIFT KEYING
Receiver for digital radio broadcasting via satellite
[ESA-86-97313] N86-30922
Four-phase modems for a satellite channel: Demodulation via differential detection
[ESA-86-97390] N86-30927
PHASE TRANSFORMATIONS
Phase relations and miscibility in polymer blends containing copolymers
[AD-A166773] N86-30868
Computer code CONDIF-01 (release 2) for transient convective-conductive heat transfer: User's manual
[DE86-780411] N86-31024
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
PHASED ARRAYS
Global coordinates and exact aberration calculations applied to physical optics modeling of complex optical systems
[DE86-008751] N86-31366
PHILOSOPHY
Research program with no measurement problem
[DE86-006952] N86-31403
PHOTOCHEMICAL REACTIONS
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
PHOTOCONDUCTIVITY
Dynamic aspects of the dye-sensitized photoconductivity of semiconductors
[DE86-007662] N86-31395
PHOTODIODES
Novel reentry vehicle instrument: The photodiode
[DE86-006234] N86-30808
PHOTODISSOCIATION
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209
PHOTOELECTRIC EMISSION
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167067] N86-31040
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
PHOTOGRAPHIC PLATES
Automated scanning of plastic nuclear track detectors using the Minnesota star scanner N86-31517
PHOTOIONIZATION
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045
PHOTOMETERS
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938
PHOTOVOLTAIC CELLS
Space power using solar photovoltaic panels: Costs and limitations
[DE86-006953] N86-31105
Proceedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31106
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model
[DE86-009539] N86-31110
PHOTOVOLTAIC EFFECT
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31382
PHYSICAL CHEMISTRY
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31208
PHYSICAL EXERCISE
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211
PHYSICAL FITNESS
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211
Induced erythrocythemia and maximal aerobic power: An examination of modifying factors
[AD-A166522] N86-31212
PHYSICAL OPTICS
Global coordinates and exact aberration calculations applied to physical optics modeling of complex optical systems
[DE86-008751] N86-31366
PHYSIOLOGICAL EFFECTS
Analysis of nystagmus response to a pseudorandom velocity input N86-31426
PHYSIOLOGICAL RESPONSES
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
PIEZOELECTRIC GAGES
Orifice plate and differential pressure measurement N86-30972
PILOT PERFORMANCE
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
The effect of breathing elevated CO2 gas mixtures on tracking performance, blood pressure, and subjective tolerance at 1Gz
[AD-A165974] N86-31210
PINCH EFFECT
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334
PIPE FLOW
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30965
First measurements with a laser Doppler anemometer in a high pressure natural gas pipe N86-30971
Orifice plate and differential pressure measurement N86-30972
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
PIPELINES
Modern differential pressure gas counter (WIGZ) measurement N86-30973
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
PIPES (TUBES)
Dimensional stability of CFRP tubes for space structures N86-30775

Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations
[DE86-008907] N86-30853

PITTING
Evaluation of the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium
[DE86-701579] N86-30859

PIXELS
Motion sensitive frame integration
[AD-D012291] N86-30917

PLANAR STRUCTURES
Development and application of the P-version of the finite element method
[AD-A166056] N86-31279

PLANE STRAIN
Topography, stresses, and stability at Yucca Mountain, Nevada
[DE86-008247] N86-31174

PLANETARY ATMOSPHERES
Studies of radiative transfer in planetary atmospheres
[NASA-CR-176898] N86-31479

PLANETARY BOUNDARY LAYER
DeWitt field study: Surface flux observations, in situ soundings and remote sensing of conditions affecting the behavior of the mixed layer over land
[DE86-008942] N86-31177

PLANETARY EVOLUTION
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127
Oceanic structures of the Earth and the North Depression of Mars: A comparison of the formation mechanisms N86-31144
The evolution of rifting process in the tectonic history of the Earth N86-31145
Lithospheric and crustal thinning N86-31147

PLANETARY GEOLOGY
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Rifting on Venus: Implications for lithospheric structure N86-31121

PLANETARY GRAVITATION
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Experiment to measure the gravitational force on the antiproton
[DE86-008725] N86-31349

PLANETARY MAGNETIC FIELDS
Magnetic fields of cosmic bodies
[DE86-701119] N86-31476

PLANETARY TEMPERATURE
A regional 17-18 MA thermal event in Southwestern Arizona N86-31126
Thermal history of a metamorphic core complex N86-31132
Thermal-mechanical response to simple shear extension N86-31133
Lithospheric and crustal thinning N86-31147
Thermal control of the style of extensional tectonics N86-31148
Heat and extension at mid- and lower crustal levels of the Rio Grande rift N86-31151

PLANETS
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Magnetic fields of cosmic bodies
[DE86-701119] N86-31476

PLASMA ACCELERATION
Observations of shock acceleration processes in the solar wind N86-31505

PLASMA CONDUCTIVITY
Comprehensive chemical analysis of metal alloys by means of inductively coupled plasma optical emission spectroscopy
[AD-A166842] N86-30841

PLASMA CONTROL
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373

PLASMA DIAGNOSTICS
Laboratory for Laser Energetics
[DE86-006834] N86-31044
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373

PLASMA DYNAMICS
Stabilities of MHD rotational discontinuities
[DE85-703231] N86-31375

PLASMA EQUILIBRIUM
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373

PLASMA JETS
Laser techniques for arc jet plasma diagnostics; continuation of a feasibility and design study N86-31435
Cosmic jets N86-31484
Gamma-ray line astrophysics N86-31485

PLASMA OSCILLATIONS
Active plasma release experiments
[NASA-CR-176897] N86-31462
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments N86-31464

PLASMA PHYSICS
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370

PLASMA WAVES
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-008564] N86-31374

PLASMA-ELECTROMAGNETIC INTERACTION
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-008564] N86-31374

PLASMAS (PHYSICS)
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
Production of ultrahigh magnetic fields
[DE86-006838] N86-31334
A magnetospheric critical velocity experiment: Particle results N86-31463

PLASTIC DEFORMATION
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074

PLASTIC PROPERTIES
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31082

PLASTICS
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-006140] N86-30825

PLATE THEORY
Orthotropic properties of layered fiber composites N86-30766

PLATEAUS
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Heat and detachment in core-complex extension N86-31139
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

PLATES (STRUCTURAL MEMBERS)
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843

PLATES (TECTONICS)
Thermal history of a metamorphic core complex N86-31132
Heat and detachment in core-complex extension N86-31139
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160

PLATINUM
Lead, platinum and other heavy elements in the primary cosmic radiation: HEAO-3 results N86-31516

PLOTTING
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169

PLUMES
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Fire control method and analytical model for large liquid hydrocarbon pool fires N86-31419

POINT DEFECTS
Properties of point defects in metals and alloys
[DE86-780413] N86-30880
Modification of point defects in quartz for device applications
[DE86-007968] N86-31394

POINT SOURCES
Observational properties of cosmic gamma-ray bursts N86-31504
Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506
The homestake surface-underground scintillators: Initial results N86-31515

POINTING CONTROL SYSTEMS
Significance and reliability of dynamic analysis methods demonstrated in the Instrument Pointing System project — Space Shuttle payload N86-30889
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807

POINTS (MATHEMATICS)
Matching extension and the genus of a graph
[AD-A166562] N86-31282

POISSON DENSITY FUNCTIONS
Martingales with given absolute value from the multiplicative decomposition of positive submartingales
[IR-224] N86-31296

POLAR REGIONS
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
Forbush decreases geomagnetic and atmospheric effects cosmogenic nuclides N86-31497

POLARIMETERS
Ultraviolet spectrometer and polarimeter (UVSP) software development and hardware tests for the solar maximum mission
[NASA-CR-177889] N86-30906

POLARITY
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Data for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181

POLARIZATION (CHARGE SEPARATION)
Study of the polarization for Incoloy 800 and for the stainless steel AISI 304 in mixtures of iron, nickel and chromium chlorides
[DE86-701576] N86-30858

POLARIZED ELECTROMAGNETIC RADIATION
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-86-97316] N86-30925

POLLUTION TRANSPORT
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939

POLYMER CHEMISTRY
Chemistry Research Resource
[DE86-008765] N86-30811

POLYMER MATRIX COMPOSITES
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763

POLYMERIC FILMS
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871

POLYMERIZATION
In-situ SAX investigations of isothermal crystallization in poly(TMPS) fractions
[DE86-003816] N86-31392

POLYQUINOXALINES
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867

POLYSTATION DOPPLER TRACKING SYSTEM
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342

PONTRYAGIN PRINCIPLE
Preliminary study of the use of Laplace and momentum vectors in the determination of interplanetary low thrust trajectories
[ESA-CR(P)-2173] N86-30745

POPULATION THEORY
Central limit theorem for variable size simple random sampling from a finite population
[DE86-007092] N86-31312

POROSITY
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
Condensation heat transfer under a microgravity environment N86-31414
POROUS BOUNDARY LAYER CONTROL
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
PORPHYRINS
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421
POSITION (LOCATION)
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] N86-30719
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
POSITRON ANNIHILATION
Induced Higgs couplings to neutral bosons in e+e- collisions
[USIP-85-08] N86-31351
Identification of neutral Higgs bosons in the DELPHI detector at LEP
[USIP-85-09] N86-31352
POTABLE WATER
Development of thermoelectric water heating-cooling devices
[AD-A166949] N86-31221
Defining reclaimed water potability requirements N86-31422
POTASSIUM
Potassium-water reactions in the vapor phase
[OEFZS-4327] N86-30833
Potassium instrumentation and experiments on potassium vapor
[OEFZS-4328] N86-30834
Potassium natural convection loop HT4, operating report number 1
[OEFZS-4329] N86-30862
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31128
POTASSIUM NITRATES
Evaluation of igniter compositions SR371C and SR44
[AD-A167007] N86-30810
POTENTIAL FLOW
Calculation of three-dimensional transonic potential flows by a field panel method — oscillating wings N86-30629
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30701
POTENTIAL GRADIENTS
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow N86-30633
POTENTIAL THEORY
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
POWDER (PARTICLES)
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879
POWDER METALLURGY
Basic studies of submicron layers of Nb-Al
[DE86-006985] N86-31389
POWER AMPLIFIERS
Intersatellite link design issues
[AD-A166761] N86-30904
PRECIPITATION (METEOROLOGY)
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
Infrared airglow clutter
[AD-A166994] N86-31171
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166628] N86-31185
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189
PREDICTION ANALYSIS TECHNIQUES
The DMA GPS Earth orientation prediction service
[AD-A166830] N86-30713
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
Damping of composites N86-30764
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
Theoretical models of single-element LTSA antenna elements N86-30892
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30958
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001
On the coherence among the multitude of system identification methods N86-31275
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31261
PREDICTIONS
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] N86-30741
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880
PREPROCESSING
Package for solving large sparse systems of stiff ordinary differential equations
[DE86-009545] N86-31292
PRESSURE DISTRIBUTION
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow N86-30633
Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods N86-30639
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil
[AD-A167313] N86-30701
Bursts and pressure fluctuations in turbulent boundary layers
[AD-A167186] N86-31012
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
PRESSURE GAGES
Potassium instrumentation and experiments on potassium vapor
[OEFZS-4328] N86-30834
PRESSURE GRADIENTS
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694
PRESSURE MEASUREMENT
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] N86-30695
Pressure and temperature measurements on natural gases along isochores in the technically important state ranging from 270 to 300 K and at pressures up to 60 bars N86-30970
Orifice plate and differential pressure measurement N86-30972
Measurement of small pressure differences at a high static pressure — gas flow N86-30977
Effects of previous disturbances on the meter factors of a vortex meter N86-30979
PRESSURE SENSORS
Measurement of small pressure differences at a high static pressure — gas flow N86-30977
PRESSURE VESSELS
The gas measuring bell: A basic normal equipment for the representation of volume unit for gases N86-30981
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
PRIMARY COSMIC RAYS
Studies of air showers produced by primaries 10(16) eV using a combined scintillation and water-Cerenkov array N86-31514
Lead, platinum and other heavy elements in the primary cosmic radiation: HEAO-3 results N86-31516
PRIMERS (COATINGS)
The variation of corrosion potential with time for coated metal surfaces
[NASA-TP-2636] N86-30837
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865
PRINCIPAL COMPONENTS ANALYSIS
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
PRINTED CIRCUITS
Testability measures on a state-of-the-art circuit
[AD-A165978] N86-30935
PROBABILITY DENSITY FUNCTIONS
Biased and unbiased cross-validation in density estimation
[AD-A166905] N86-31283
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309
PROBABILITY DISTRIBUTION FUNCTIONS
Performance of discrete-time predictors of continuous-time stationary processes
[AD-A166231] N86-31261
PROBABILITY THEORY
Impact of the human on system safety analysis
[DE86-006182] N86-31224
The best bound in the L log L inequality of Hardy and Littlewood and its martingale counterpart
[IR-266] N86-31305
Central limit theorem for variable size simple random sampling from a finite population
[DE86-007092] N86-31312
Some continuity theorems in probability
[IR-257] N86-31315
PROBLEM SOLVING
The numerical solution of the Navier-Stokes equations for incompressible flows and the applicability of the stream function formulation of the Navier-Stokes equations
[AD-A166061] N86-31002
Remarks on the choice of a stiff ordinary differential equation solver for the solution of fluid flow problems
[DE86-010080] N86-31028
Representation for closed form significance testing in VL1 N86-31219
A discrete control model of PLANT N86-31220
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
Unique solution to a nonlinear ordinary differential equation
[DE86-005236] N86-31286
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700605] N86-31287
Potential for parallelism in ordinary differential equations
[DE86-007594] N86-31288
Package for solving large sparse systems of stiff ordinary differential equations
[DE86-009545] N86-31292
Development of a numerical procedure to map a general 3-d body onto a near-circle N86-31420
PRODUCT DEVELOPMENT
Design and development of the Advanced Rigid Array (ARA) solar panel — composite structures N86-30796
Developments and trends in environmental protection
[OEFZS-4342] N86-31118
Development of dynamic very large scale integration memories
[BMFT-FB-T-85-176] N86-31234
PRODUCTION ENGINEERING
An example of integrated logistic support applied also to production testing — aircraft industry N86-30698
PRODUCTION MANAGEMENT
Real-time production system for intelligent robot control
[DE86-008501] N86-31271
PRODUCTIVITY
Robot-assisted torque measurement
[DE86-009129] N86-31061
PROGRAM VERIFICATION (COMPUTERS)
Ada (trade name) compiler validation summary report: AFATL Ada cross-compiler version 1.0, CDC cyber host/Zilog z8002 target
[AD-A166212] N86-31229
PROGRAMMING LANGUAGES
Integration of an expert system into a user interface language demonstration N86-31432
A guide to lexical acquisition in the JANUS system
[AD-A166078] N86-31443

PROJECT MANAGEMENT
Proposal to NIVR for a system definition study of a Tropical Earth Resources Satellite (TERS) --- Netherlands Agency for Aerospace Programs (NIVR)
[NTERS-84-11] N86-31096
PROJECTILES
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752
PROPAGATION MODES
Circular waveguide mode converters at 140 GHz
[DE86-009075] N86-30953
PROPELLANT SENSITIVITY
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165969] N86-30884
PROPELLANT TRANSFER
An analysis of ullage heat transfer in the orbital refueling system N86-31424
PROPELLANTS
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-006140] N86-30825
PROPELLER EFFICIENCY
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] N86-30693
PROPELLERS
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] N86-31338
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] N86-31341
PROPULSION SYSTEM CONFIGURATIONS
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30694
PROTECTIVE COATINGS
The variation of corrosion potential with time for coated metal surfaces
[NASA-TP-2636] N86-30837
PROTONS
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4800 mwe) N86-31509
PROTOTYPES
High accuracy fuel flowmeter
[NASA-CR-174869] N86-31030
Robot-assisted torque measurement
[DE86-009129] N86-31061
PROVING
Ada (trade name) compiler validation summary report: Verdix Ada development system, version 5.2 for the sequent balance under DYNIX, release 1.3.2
[AD-A167231] N86-31232
PSYCHOACOUSTICS
Acoustics Division recent accomplishments and research plans
[NASA-TM-89012] N86-31340
PSYCHOPHYSICS
Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217
PULSARS
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
PULSE AMPLITUDE
Development of a pulse height analyzer
[DE86-700768] N86-31034
PULSE CODE MODULATION
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
Active plasma release experiments
[NASA-CR-176897] N86-31462
PULSE COMPRESSION
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
PULSE RADAR
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
PULSED LASERS
Transient excitation of anharmonic adspecies by pulsed laser radiation
[AD-A166308] N86-31038
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048
PUMP SEALS
Performance of oil pumping rings: An analytical and experimental study
[NASA-CR-175083] N86-31000
PUMPS
Tritium gas transfer pump development
[DE86-007164] N86-31056

Q

QUADRANTS
Extreme point methods in the determination of the structure of a class of bivariate distributions and some applications to contingency tables
[AD-A167230] N86-31285
QUADRATIC PROGRAMMING
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009083] N86-31256
QUADRUPOLES
AE monitoring instrumentation for high performance superconducting dipoles and quadrupoles, Phase 2
[DE86-007414] N86-31035
QUALITY CONTROL
Accuracy of high pressure gas meter calibration in the Netherlands N86-30968
QUANTUM CHROMODYNAMICS
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353
Experimental and theoretical high energy physics
[DE86-009052] N86-31356
QUANTUM ELECTRONICS
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938
European Science Notes, volume 40, number 5
[AD-A166682] N86-31455
QUANTUM MECHANICS
Variational coupling between Q-number and C-number dynamics
[DE86-700604] N86-31321
Research program with no measurement problem
[DE86-006952] N86-31403
QUANTUM NUMBERS
Variational coupling between Q-number and C-number dynamics
[DE86-700604] N86-31321
QUANTUM THEORY
Studies of highly excited atoms
[AD-A166838] N86-31348
QUANTUM WELLS
Theoretical and material studies on thin-film electroluminescent devices
[NASA-CR-177150] N86-30932
QUARKS
Feynman diagrams as functions of quark mass matrices, CP-violation, electric dipole moments and theta-parameter of QCD
[USIP-85-22] N86-31353
QUARTZ
Modification of point defects in quartz for device applications
[DE86-007988] N86-31394
QUASARS
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700669] N86-31471
Extragalactic astronomy N86-31489

R

RABBITS
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213
RADAR ANTENNAS
Energy and Technology Review, June 1985
[DE85-014146] N86-31333
RADAR APPROACH CONTROL
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] N86-30707
RADAR CROSS SECTIONS
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30931
RADAR DATA
Number theory: A Proposal for high speed processors --- radar signals N86-30895
RADAR ECHOES
A model description for radar reflection on the sea surface 2
[ESA-86-97553] N86-30928
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30931
RADAR GEOLOGY
Geology --- X-SAR/SIR-C mission N86-31088
RADAR MEASUREMENT
The determination of modulation transfer functions from the 'Noordwijk' radar measurements in 1978 and 1979 --- offshore platform
[BCRS-85-02] N86-30921
Determination of the thermospheric neutral wind from incoherent scatter radar measurements
[KGI-186] N86-31178
RADAR SCATTERING
A model description for radar reflection on the sea surface 2
[ESA-86-97553] N86-30928
RADAR SIGNATURES
A model description for radar reflection on the sea surface 2
[ESA-86-97553] N86-30928
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30931
RADAR TARGETS
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
Multistatic detection of radar signals for Swerling models of the target N86-30896
RADIATION COUNTERS
Automated scanning of plastic nuclear track detectors using the Minnesota star scanner N86-31517
High energy electrons beyond 100 GEV observed by emulsion chamber N86-31519
RADIATION DAMAGE
Effect of neutron irradiation on vanadium alloys
[DE86-009156] N86-30851
Platinum particles in the Nd:doped disks of phosphate glass in the Nova laser
[DE86-007119] N86-30875
RADIATION DETECTORS
Support of the balloon-borne ultraviolet stellar spectrograph
[NASA-CR-177152] N86-31031
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342
RADIATION DOSAGE
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431
RADIATION EFFECTS
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
Refractory alloy performance: unresolved issues and status summary
[DE85-014657] N86-30949
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
Testing, design and modeling issues in radiation-hardened CMOS integrated circuits
[DE86-007707] N86-30949
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957
Physical processes associated with radiation-induced interface states
[AD-A167280] N86-31386
Modification of point defects in quartz for device applications
[DE86-007988] N86-31394
RADIATION HARDENING
Testing, design and modeling issues in radiation-hardened CMOS integrated circuits
[DE86-007707] N86-30949
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31382

RADIATION HAZARDS
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214
RADIATION MEASUREMENT
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] N86-30735
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
RADIATION SHIELDING
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
RADIATION SOURCES
Track parameter extraction using multipath delay and Doppler information
[AD-A166044] N86-31342
RADIATION TRANSPORT
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
RADIATIVE TRANSFER
Results of comparison studies of infrared radiative transfer models
[DE86-006531] N86-31191
Studies of radiative transfer in planetary atmospheres
[NASA-CR-176898] N86-31479
RADII
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908
RADIO BURSTS
Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502
RADIO EMISSION
Cerenkov radiation and electromagnetic pulse produced by electron beams traversing a finite path in air
[AD-A167058] N86-30911
RADIO EQUIPMENT
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
RADIO FREQUENCIES
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
RADIO FREQUENCY INTERFERENCE
Methods for developing jam-resistant security communications networks at fixed-site facilities
[DE86-001321] N86-30920
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30938
RADIO GALAXIES
Extragalactic astronomy N86-31489
RADIO RECEIVERS
Specification of a NAVSTAR Global Positioning System (GPS) receiver for a differential GPS ground system
[NASA-CR-177073] N86-30710
RADIO SIGNALS
Double sideband generation with serrodyne modulators
[AD-D012293] N86-30918
RADIO TRANSMISSION
Connecticut ELF (Extremely Low Frequency) field-strength measurements, August to December 1977 and July to September 1978
[AD-A167344] N86-30916
Methods for developing jam-resistant security communications networks at fixed-site facilities
[DE86-001321] N86-30920
RADIO WAVES
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214
Stabilization of magnetohydrodynamic modes by applied radiofrequency waves
[DE86-008564] N86-31374
RADIOACTIVE DECAY
High energy interactions of cosmic ray particles N86-31498
RADIOACTIVE ISOTOPES
Cosmogenic nuclei N86-31488
RADIOGRAPHY
Simple, compact, high brightness source for X-ray lithography and X-ray radiography
[DE86-009723] N86-30956
RAILGUN ACCELERATORS
Himass electromagnetic launcher at Los Alamos
[DE86-008734] N86-30748
Railguns powered by explosive driven flux compression generators
[DE86-008735] N86-30749
Launcher barrel for the lethality test system railgun
[DE86-008739] N86-30750
Railgun conductor heating from multiple current pulses
[DE86-008724] N86-30752
Experimental measurement of ablation effects in plasma armature railguns
[DE86-008740] N86-30950
Numerical predictions of railgun performance including the effects of ablation and arc drag
[DE86-008718] N86-31355
RAILS
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
RAIN
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-86-97316] N86-30925
Chemical instrumentation for field studies of atmospheric wet deposition processes
[DE86-005255] N86-31175
RAMAN SPECTRA
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
RAMAN SPECTROSCOPY
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
RANDOM ACCESS MEMORY
Development of dynamic very large scale integration memories
[BMFT-FB-T-85-176] N86-31234
RANDOM NOISE
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
RANDOM PROCESSES
Dynamic response moments of random parameterized structures with random excitation
[DE86-004567] N86-31079
Expected performance of m-solution backtracking
[NASA-CR-178162] N86-31236
RANDOM SAMPLING
Central limit theorem for variable size simple random sampling from a finite population
[DE86-007092] N86-31312
RANDOM VARIABLES
Some continuity theorems in probability
[IR-257] N86-31315
RANDOM VIBRATION
Influence of axial force on random vibration response of a structure N86-30667
RANGELANDS
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
RAYLEIGH DISTRIBUTION
Multistatic detection of radar signals for Swerling models of the target N86-30896
RAYLEIGH SCATTERING
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
Effects of surface microroughness in ellipsometry
[DE86-008014] N86-31364
REACTION KINETICS
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
Potassium-water reactions in the vapor phase
[OEFZS-4327] N86-30833
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31168
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209
REACTIVITY
Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379
REACTOR PHYSICS
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
READERS
Airborne navigation remote map reader evaluation
[AD-A166976] N86-30729
REAL GASES
Structure of the equation of state of real gases and liquids
[PTB-ME-69] N86-30832
REAL NUMBERS
A method for constructing ordered continua
[IR-240] N86-31324
REAL TIME OPERATION
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30726
Theory and operation of the real-time data acquisition system for the NASA-LaRC differential absorption lidar (DIAL)
[NASA-CR-177151] N86-31036
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 1
[AD-A166351] N86-31230
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 2
[AD-A166352] N86-31231
Real-time production system for intelligent robot control
[DE86-006501] N86-31271
RECEIVERS
A GaAs based digital serial communications system
[AD-A166060] N86-30900
Falling film flow characteristics of the direct absorption receiver
[DE86-004432] N86-31111
Problems in nonlinear acoustics: Parametric receiving arrays, focused finite amplitude sound and dispersive nonlinear interactions
[AD-A167311] N86-31343
RECRYSTALLIZATION
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855
RECTANGULAR PANELS
Design and development of the Advanced Rigid Array (ARA) solar panel --- composite structures N86-30796
RED SEA
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Thermal control of the style of extensional tectonics N86-31148
RED SHIFT
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700669] N86-31471
Extragalactic astronomy N86-31489
REDUCTION (CHEMISTRY)
Study of settling of metallized sinter in reducing atmosphere
[BLL-M-36597-(5828.4)] N86-30636
REENTRY VEHICLES
Novel reentry vehicle instrument: The photodiode
[DE86-006234] N86-30808
REFLECTANCE
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31368
REFLECTION
Triple cavity laser
[AD-D012292] N86-31042
Effects of surface microroughness in ellipsometry
[DE86-008014] N86-31364
REFLECTORS
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31368
REFRACTORY MATERIALS
Pulsed laser and ion beam surface modification of sintered alpha-SiC
[DE86-008978] N86-30816
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30838
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
REFRACTORY METALS
Refractory alloy performance: unresolved issues and status summary
[DE85-014657] N86-30849
REFRIGERANTS
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750845] N86-31015
REFUELING
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725

REGRESSION ANALYSIS
System Identification. Mini course
[ER-84/02] N86-31274
A generalized diagram for various parameter estimation methods; the coherence in pseudo-linear regression schemes N86-31276
All subsets regression in Cox model
[AD-A166897] N86-31310
REGULATIONS
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] N86-30719
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744
REINFORCEMENT (STRUCTURES)
Adequate fiber reinforced structural elements in load introduction area of fiber reinforced shells N86-30770
RELATIVISTIC ELECTRON BEAMS
Cerenkov radiation and electromagnetic pulse produced by electron beams traversing a finite path in air
[AD-A167058] N86-30911
One dimensional models for relativistic electron beam diode design
[AD-A165953] N86-30934
Relativistic klystron
[DE86-009217] N86-30951
RELATIVISTIC PARTICLES
High energy nucleus-nucleus collisions N86-31513
Cosmic ray anisotropies at high energies N86-31518
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520
RELATIVISTIC PLASMAS
Cosmic jets N86-31484
RELATIVISTIC THEORY
Relativistic cosmologies with closed, locally homogeneous space sections
[DE86-700673] N86-31473
RELATIVITY
Superconformal Lagrangian without the need to introduce constraints
[DE86-009006] N86-31291
Possible violations of the relativity theory
[DE86-700611] N86-31404
Einstein's special relativity versus Lorentz's Aether theory
[DE86-700627] N86-31405
RELIABILITY ANALYSIS
Impact of the human on system safety analysis
[DE86-008182] N86-31224
Towards automatic Markov reliability modeling of computer architectures
[NASA-TM-89009] N86-31316
RELIABILITY ENGINEERING
Significance and reliability of dynamic analysis methods demonstrated in the Instrument Pointing System project — Space Shuttle payload N86-30689
REMOTE SENSING
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933
The X-SAR science plan — SIR-C
[DFVLR-MITT-85-17] N86-31084
The X-SAR science team — SIR-C N86-31085
Principle of SAR and X-SAR performance. The X-SAR/SIR-C mission. Some remarks concerning organization aspects N86-31086
Hydrology — X-SAR/SIR-C mission N86-31089
Oceanography — X-SAR/SIR-C mission N86-31090
Ice and snow — X-SAR/SIC-C mission N86-31091
Vegetation — X-SAR/SIR-C mission N86-31092
Earth observing system. Data and information system. Volume 2A: Report of the EOS Data Panel
[NASA-TM-87777] N86-31094
Phase A technical study summary report for a Tropical Earth Resources satellite (TERS)
[JTERS-84-07] N86-31097
Proposal to NIVR for a system definition study of a Tropical Earth Resources Satellite (TERS) — Netherlands Agency for Aerospace Programs (NIVR)
[NTERS-84-11] N86-31098
Application of computer image enhancement techniques to shuttle hand-held photography N86-31416
RENDEZVOUS SPACECRAFT
Ada (trade name) training curriculum. Real-time systems in Ada 1401 teacher's guide, volume 1
[AD-A166351] N86-31230
REPORTS
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453
REQUIREMENTS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714
RESEARCH
Evaluation of research: Experiences and perspectives in the Netherlands
[ESA-86-96709] N86-31461
RESEARCH AIRCRAFT
Modified US Army U-8F ground vibration test
[NASA-TM-86741] N86-30723
Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] N86-31237
RESEARCH AND DEVELOPMENT
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
The Department of Defense statement on science in the mission agencies and federal laboratories before the Task Force on Science Policy of the Committee on Science and Technology of the United States House of Representatives, 99th Congress, first session
[AD-A166041] N86-31438
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
Integrated library system at ORNL: LION
[DE86-005857] N86-31448
RESEARCH MANAGEMENT
Free-electron lasers for strategic defense: The benefits of scientific open scientific exchange
[DE86-006033] N86-31046
Hampton University/American Society for Engineering Education/NASA Summer Faculty Fellowship Program 1986
[NASA-CR-178169] N86-31437
The Department of Defense statement on science in the mission agencies and federal laboratories before the Task Force on Science Policy of the Committee on Science and Technology of the United States House of Representatives, 99th Congress, first session
[AD-A166041] N86-31438
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
Directory of researches for human research and development projects
[AD-A167100] N86-31445
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453
Evaluation of research: Experiences and perspectives in the Netherlands
[ESA-86-96709] N86-31461
RESIDUAL STRENGTH
Assessing the effects of delaminations on the postbuckling strength of CRFP panels — aircraft structures N86-30761
RESIDUAL STRESS
Thermal residual stresses in symmetric and unsymmetric carbon fiber reinforced plastics: Some tentative ways of evaluation N86-30762
Numerical and experimental study of residual stresses and thermal fatigue in soldered electronic assemblies
[DE86-008779] N86-30952
RESIN MATRIX COMPOSITES
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763
RESONANCE FLUORESCENCE
Studies of highly excited atoms
[AD-A166838] N86-31348
RESONANCE TESTING
Determination of force distributions in multi-point resonance testing using various direct methods N86-30673
RESONANT FREQUENCIES
A 3-D analysis of Maxwell's equations for cavities of arbitrary shape
[DE85-007883] N86-30919
RESONANT VIBRATION
Determination of both complex characteristic structural values and normal mode parameters from harmonic excitation near resonance N86-30668
RESONATORS
Analysis of a doubly coupled single fiber resonator
[AD-A166851] N86-31033
RESOURCES
Chemistry Research Resource
[DE86-008765] N86-30811
RESOURCES MANAGEMENT
JPL preferred parts list: Reliable electronic components
[NASA-CR-176258] N86-30889
Using SMF records in managing a CADAM system
[DE86-006408] N86-31253
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440
RESPIRATORY RATE
The effect of breathing elevated CO2 gas mixtures on tracking performance, blood pressure, and subjective tolerance at 1Gz
[AD-A165974] N86-31210
REVERSE FIELD PINCH
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373
REVISIONS
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
REYNOLDS NUMBER
Influence of the form of the vortex bodies on the technical performance of a vortex meter N86-30878
RHEOLOGY
A numerical study of forced lithospheric thinning N86-31158
RINGS
The Hopf algebra of symmetric functions
[IR-250] N86-31325
RISK
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744
Impact of the human on system safety analysis
[DE86-008182] N86-31224
RIVERS
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
ROBOTICS
Geographic information systems in robotic vehicles
[AD-A166859] N86-31063
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
Investigation of local area networks for an orbiting space station N86-31417
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
ROBOTS
Robot-assisted torque measurement
[DE86-009129] N86-31061
Real-time production system for intelligent robot control
[DE86-006501] N86-31271
ROBUSTNESS (MATHEMATICS)
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] N86-30732
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] N86-31266
ROCK MECHANICS
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen N86-31141
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143
Thermal control of the style of extensional tectonics N86-31148
Cenozoic extension and magmatism in Arizona N86-31158
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164
Topography, stresses, and stability at Yucca Mountain, Nevada
[DE86-008247] N86-31174
ROCKET ENGINE CASES
Fiber reinforced plastic cases for solid propellant motors N86-30793
ROCKET ENGINE DESIGN
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809
ROCKET ENGINES
Low-thrust rocket trajectories
[DE86-007573] N86-30754

Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

ROCKET OXIDIZERS
Descriptive characterization of solid ingredients
[AD-A166874] N86-30885

ROCKET PROPELLANTS
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

ROCKET THRUST
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30869

ROCKET-BORNE INSTRUMENTS
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments
N86-31464

ROCKS
Io: Mountains and crustal extension N86-31135
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164

ROTARY WINGS
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity
N86-30638
Structural dynamic aspects of rotor nodal isolation — helicopters N86-30665
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070

ROTATION
Stabilities of MHD rotational discontinuities
[DE85-703231] N86-31375

ROTOR AERODYNAMICS
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity
N86-30638

ROTOR BLADES (TURBOMACHINERY)
Sensitivity analysis and optimization of nodal point placement for vibration reduction
[NASA-TM-87763] N86-31069

ROTORS
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005

RYDBERG SERIES
Recombination and reactions in dense ionized gases
[AD-A166190] N86-31371

S

SAFETY
Impact of the human on system safety analysis
[DE86-008182] N86-31224

SAHARA DESERT (AFRICA)
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166832] N86-31187

SAMPLING
Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116
On the construction of martingales with given absolute value, 2
[IR-241] N86-31299
The best bound in the L log L inequality of Hardy and Littlewood and its martingale counterpart
[IR-266] N86-31305
The Azema-Yor stopping time and ultimateness
[IR-273] N86-31331

SANDWICH STRUCTURES
Thermal stability of sandwich reflectors — spacecraft antennas N86-30774
Structural analysis, manufacturing and test evaluation of a polarization sensitive reflector N86-30798

SATELLITE DESIGN
Phase A technical study summary report for a Tropical Earth Resources satellite (TERS)
[JTERS-84-07] N86-31097
Proposal to NIVR for a system definition study of a Tropical Earth Resources Satellite (TERS) — Netherlands Agency for Aerospace Programs (NIVR)
[NTERS-84-11] N86-31098

SATELLITE OBSERVATION
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933

SATELLITE TELEVISION
Receiver for digital radio broadcasting via satellite
[ESA-86-97313] N86-30922

SATELLITE-BORNE PHOTOGRAPHY
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205

SATURN SATELLITES
Extensional tectonics of the Saturnian Satellites
N86-31146

SCALE (CORROSION)
Himass electromagnetic launcher at Los Alamos
[DE86-008734] N86-30748

SCALE MODELS
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704

SCANDIUM COMPOUNDS
Growth of large GSGG crystals
[DE86-006700] N86-31391

SCANNING
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30726

SCATTERING
Research program with no measurement problem
[DE86-006952] N86-31403

SCHROEDINGER EQUATION
Theoretical and material studies on thin-film electroluminescent devices
[NASA-CR-177150] N86-30932

SCIENTISTS
Topics on cosmic rays. Vol. 1: 60th anniversary of C.M.G. Lattes
[DE86-700674] N86-31523

SCINTILLATION COUNTERS
Studies of air showers produced by primaries 10(16) eV using a combined scintillation and water-Cerenkov array N86-31514
The homestake surface-underground scintillators: Initial results N86-31515

SEA SURFACE TEMPERATURE
A general circulation model investigation of the atmospheric response to El Nino
[PB86-196243] N86-31206

SEALS (STOPPERS)
Oil hydraulics in Arctic regions
[DE86-751569] N86-31060

SEAMOUNTS
Effects of lunar soil, Zagami meteorite, and ocean ridge basalt on the excretion of itoic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421

SEARCH PROFILES
Expected performance of m-solution backtracking
[NASA-CR-178162] N86-31236

SEATS
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] N86-30702

SECONDARY EMISSION
Particle acceleration by the sun N86-31494

SEDIMENT TRANSPORT
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203

SEDIMENTARY ROCKS
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes
N86-31128
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen
N86-31141

SEDIMENTS
A regional 17-18 MA thermal event in Southwestern Arizona N86-31126
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

SEISMIC WAVES
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170

SEISMOGRAMS
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241

SEISMOLOGY
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136
Low-angle normal faulting and isostatic response in the Gulf of Suez: Evidence from seismic interpretation and geometric reconstruction N86-31152
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241

SELECTION
Intersatellite link design issues
[AD-A166761] N86-30904

SELF ORGANIZING SYSTEMS
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216

SEMICONDUCTOR DEVICES
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30936
Semiconductor device modeling on a workstation
[DE86-001125] N86-31249

SEMICONDUCTOR LASERS
Triple cavity laser
[AD-D012292] N86-31042

SEMICONDUCTORS (MATERIALS)
Reactions of laser-generated free radicals at semiconductor surfaces
[AD-A166233] N86-31379
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31382
Semiconductor alloy theory
[AD-A167306] N86-31387
Dynamic aspects of the dye-sensitized photoconductivity of semiconductors
[DE86-007662] N86-31395
Core level shifts in semiconductors: A study of the electrostatic model
[DE85-703224] N86-31402

SENSITIVITY
Sensitivity analysis of a numerically simulated HgCdTe solidification process by statistical methods
[DE86-007935] N86-30847
Sensitivity analysis and optimization of nodal point placement for vibration reduction
[NASA-TM-87763] N86-31069

SEPARATED FLOW
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow
N86-30632
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] N86-31010

SEQUENCING
Sequential and parallel matrix computations
[AD-A166062] N86-31320

SEQUENTIAL CONTROL
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243

SERIES (MATHEMATICS)
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation
[DE86-700605] N86-31287

SERVICE LIFE
Advances in the study of the mechanical behavior of materials
[AD-A164656] N86-30836
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865
Lifetime prediction of organic coating/metal systems
[AD-A167281] N86-30871
Research, development and demonstration of lead-acid batteries for electric vehicle propulsion
[DE86-006518] N86-31107

SET THEORY
Property C and fine homotopy equivalences
[IR-233] N86-31298
A method for constructing ordered continua
[IR-240] N86-31324
A separable normal topological group which is not Lindeloef
[IR-252] N86-31326
On the product of homogeneous spaces
[IR-274] N86-31332

SHAPE CONTROL
Aspects of active isolation as applied to a satellite structure with shape precision payload N86-30653

SHAPED CHARGES
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments
N86-31464

SHEAR LAYERS
Turbulent Shear-Layer/Shock-Wave interaction
[AD-A166934] N86-31008
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357

SHEAR PROPERTIES
Thermal-mechanical response to simple shear extension N86-31133
Brittle extension of the continental crust along a rooted system of low-angle normal faults: Colorado River extensional corridor N86-31137
SHEAR STRENGTH
Theory of strengthening by ordered precipitates
[DE86-009355] N86-30861
SHEAR STRESS
Analytical and experimental results of advanced composite stiffened panels under combined loads N86-30768
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071
Low-angle normal faults-low differential stress at mid crustal levels N86-31154
SHEARING
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
SHELL THEORY
Hand calculation method for buckling of composite shell structures N86-30769
SHIPS
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
SHOCK ABSORBERS
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
Low temperature rate controller
[AD-D012277] N86-31052
SHOCK FRONTS
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520
SHOCK WAVE INTERACTION
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
Turbulent Shear-Layer/Shock-Wave interaction
[AD-A166934] N86-31008
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] N86-31010
SHOCK WAVE PROPAGATION
Bistatic phase sounding in the ionosphere above the Minor Scale explosion
[DE86-008582] N86-31176
Observations of shock acceleration processes in the solar wind N86-31505
SHOCK WAVES
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914
SHORELINES
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
SHORT CIRCUITS
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
SHRINKAGE
Study of settling of metallized sinter in reducing atmosphere
[BLL-M-36597-(5828.4)] N86-30836
SHUTTLE IMAGING RADAR
The X-SAR science plan — SIR-C
[DFVLR-MITT-85-17] N86-31084
The X-SAR science team — SIR-C N86-31085
Principle of SAR and X-SAR performance. The X-SAR/SIR-C mission. Some remarks concerning organization aspects N86-31086
Radar technology — X-SAR/SIR-C mission N86-31087
Geology — X-SAR/SIR-C mission N86-31088
Hydrology — X-SAR/SIR-C mission N86-31089
Oceanography — X-SAR/SIR-C mission N86-31090
Ice and snow — X-SAR/SIC-C mission N86-31091
Vegetation — X-SAR/SIR-C mission N86-31092
SHUTTLE PALLET SATELLITES
Strength of carbon fiber composite/titanium bonded joints as used for SPAS-type structures N86-30794
SIDE-LOOKING RADAR
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728
A model description for radar reflection on the sea surface 2
[ESA-86-97553] N86-30928
SIDEBANDS
Double sideband generation with serrodyne modulators
[AD-D012293] N86-30918
SIDELOBES
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
SIDESLIP
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
SIEVES
Space station molecular sieve development
[NASA-CR-178885] N86-30864
Sieves for Gaussian processes
[AD-A166055] N86-31319
SIGNAL ANALYSIS
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Signal delay in leaky RC mesh models for bipolar interconnect
[AD-A166786] N86-30940
SIGNAL DETECTION
Multistatic detection of radar signals for Swerling models of the target N86-30896
Four-phase modems for a satellite channel: Demodulation via differential detection
[ESA-86-97390] N86-30927
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309
SIGNAL PROCESSING
Rivista Tecnica Selenia, volume 9, number 4
[ESA-86-97244] N86-30894
Number theory: A Proposal for high speed processors — radar signals N86-30895
Magnetostatic wave application to microwave analog signal processing N86-30897
Advanced architectures for digital signal processors
[AD-A166921] N86-30905
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements
[AD-A167175] N86-30912
Signal processing using model selection methods
[AD-A167318] N86-30915
Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506
SIGNAL TO NOISE RATIOS
Tables for obtaining confidence bounds for realized signal to noise ratio with an estimated discriminant function
[AD-A166059] N86-31309
Studies of radiative transfer in planetary atmospheres
[NASA-CR-176698] N86-31479
SILICA GEL
Silica gel sorption properties under adiabatic conditions
[DE86-004439] N86-30831
SILICIDES
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
SILICON
Testing, design and modeling issues in radiation-hardened CMOS integrated circuits
[DE86-007707] N86-30949
Inelastic scattering in condensed matter with high intensity Mossbauer radiation
[DE86-007007] N86-31400
SILICON ALLOYS
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Semiconductor alloy theory
[AD-A167306] N86-31387
SILICON CARBIDES
Improved fiber-reinforced SiC composites fabricated by chemical vapor infiltration
[DE86-008539] N86-30814
Pulsed laser and ion beam surface modification of sintered alpha-SiC
[DE86-008978] N86-30816
Corrosion of SiC ceramics in synthetic combustion atmospheres containing halides
[DE86-006732] N86-30873
SILICON FILMS
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-008791] N86-31398
SILICONES
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880
SIMILARITY THEOREM
Anisotropic wing aeroelastic theories with warping effects N86-30659
SIMULATION
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
Biased and unbiased cross-validation in density estimation
[AD-A166905] N86-31283
An IBM PC-based math model for space station solar array simulation N86-31418
SIMULATORS
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30888
A coherent VLSI design environment
[AD-A166848] N86-30944
SINGLE CRYSTALS
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381
SINGLE-PHASE FLOW
Pressure and temperature measurements on natural gases along isochores in the technically important state ranging from 270 to 300 K and at pressures up to 60 bars N86-30970
SINTERING
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
SIZE DISTRIBUTION
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
Determination of grain size distribution function using two-dimensional Fourier transforms of tone pulse encoded images
[NASA-TM-88790] N86-31065
SKY BRIGHTNESS
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Sky luminance and direct beam illuminance
[PB86-196755] N86-31180
SKY RADIATION
Sky luminance and direct beam illuminance
[PB86-196755] N86-31180
SKY WAVES
Striation effect on HF signals
[AD-A167017] N86-30909
SLEDS
Ground launched missile controlled rate decelerator
[AD-D012212] N86-30747
SLEEVES
Double-stage air filter
[AD-D012307] N86-31054
SLIDING
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143
SLOT ANTENNAS
Near millimeter wave imaging/multi-beam integrated antennas
[NASA-CR-176869] N86-30891
Theoretical models of single-element LTSA antenna elements N86-30892
SLOTS
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
SNOW
Ice and snow — X-SAR/SIC-C mission N86-31091
SNOW COVER
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
SNOWSTORMS
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
SODIUM
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31168
SOFTWARE ENGINEERING
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
Ultraviolet spectrometer and polarimeter (UVSP) software development and hardware tests for the solar maximum mission
[NASA-CR-177889] N86-30606

Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807
Pilot interaction with automated airborne decision making systems
[NASA-CR-176986] N86-31218
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 1
[AD-A166366] N86-31239
Software protection: Myth or reality
[DE86-003719] N86-31247
Los Alamos software development tools
[DE86-006024] N86-31248
Hypercube algorithms and implementations
[DE86-007439] N86-31253
A primer for program managers: Embedded software acquisition
[AD-A166731] N86-31441
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446

SOFTWARE TOOLS
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243
Los Alamos software development tools
[DE86-006024] N86-31248
Confidence ellipse research software (EAAF)
[NASA-CR-176983] N86-31260
Distributed synthetic aperture radar simulation
N86-31413
Engineering graphics data entry for space station data base
N86-31425
Automation of review/approval cycle of MCAUTO CAD/CAM generated drawings and documents
N86-31429

SOIL MOISTURE
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933

SOILS
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080

SOLAR ACTIVITY
Evaluation of the total magnetospheric energy output parameter, U/sub T/
[DE86-006017] N86-31173
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
Solar-Geophysical Data Number 497, January 1986. Part 2: (Comprehensive reports). Data for July 1985, and miscellanea
[NASA-CR-177169] N86-31182
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-188802] N86-31482

SOLAR ACTIVITY EFFECTS
Application of solar max ACRIM data to analyze solar-driven climatic variability on Earth
[NASA-CR-176855] N86-31183
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522

SOLAR ARRAYS
Design and development of the Advanced Rigid Array (ARA) solar panel — composite structures N86-30796
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
An IBM PC-based math model for space station solar array simulation N86-31418

SOLAR CELLS
Summary of mathematical models for a conventional and vertical junction photoconverter
[NASA-CR-177144] N86-31099
Procedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31106
Development of a thin AGaAs solar cell
[DE86-009544] N86-31112

SOLAR COSMIC RAYS
Cosmogenic nuclei N86-31486
Forbush decreases geomagnetic and atmospheric effects cosmogenic nuclides N86-31497

SOLAR DYNAMIC POWER SYSTEMS
Numerical study of the performance of latent heat storage for solar dynamic power systems
[DE86-006746] N86-31104

SOLAR ELECTRONS
Particle acceleration by the sun N86-31494

SOLAR ENERGY
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446

SOLAR ENERGY ABSORBERS
Falling film flow characteristics of the direct absorption receiver
[DE86-004432] N86-31111

SOLAR FLARES
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
Solar-Geophysical Data Number 497, January 1986. Part 2: (Comprehensive reports). Data for July 1985, and miscellanea
[NASA-CR-177169] N86-31182
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431
Gamma-ray line astrophysics N86-31485
Particle acceleration by the sun N86-31494
Coronal and interplanetary propagation, interplanetary acceleration, cosmic-ray observations by deep space network and anomalous component N86-31495

SOLAR HEATING
Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations
[DE86-008907] N86-30853

SOLAR MAGNETIC FIELD
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181

SOLAR MAXIMUM MISSION
Ultraviolet spectrometer and polarimeter (UVSP) software development and hardware tests for the solar maximum mission
[NASA-CR-177889] N86-30806

SOLAR NEUTRINOS
Particle acceleration by the sun N86-31494

SOLAR PHYSICS
Particle acceleration by the sun N86-31494

SOLAR PROMINENCES
Solar-Geophysical Data Number 497, January 1986. Part 2: (Comprehensive reports). Data for July 1985, and miscellanea
[NASA-CR-177169] N86-31182

SOLAR PROTONS
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431

SOLAR RADIATION
A magnetospheric critical velocity experiment: Particle results N86-31463
Coronal and interplanetary propagation, interplanetary acceleration, cosmic-ray observations by deep space network and anomalous component N86-31495

SOLAR RADIO EMISSION
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Date for December 1985, November 1985 and late data
[NASA-CR-177170] N86-31181
Solar-Geophysical Data Number 497, January 1986. Part 2: (Comprehensive reports). Data for July 1985, and miscellanea
[NASA-CR-177169] N86-31182

SOLAR TERRESTRIAL INTERACTIONS
Application of solar max ACRIM data to analyze solar-driven climatic variability on Earth
[NASA-CR-176855] N86-31183

SOLAR WIND
Evaluation of the total magnetospheric energy output parameter, U/sub T/
[DE86-006017] N86-31173
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31451
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496
Observations of shock acceleration processes in the solar wind N86-31505
Elemental abundances in corotating events
N86-31521
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522

SOLAR X-RAYS
Solar-Geophysical Data Number 497, January 1986. Part 2: (Comprehensive reports). Data for July 1985, and miscellanea
[NASA-CR-177169] N86-31182

SOLAR-PUMPED LASERS
Design and chemical synthesis of iodine-containing molecules for application to solar-pumped I* lasers
[NASA-CR-176854] N86-31037

SOLDERED JOINTS
Numerical and experimental study of residual stresses and thermal fatigue in soldered electronic assemblies
[DE86-008779] N86-30952

SOLDERING
Numerical and experimental study of residual stresses and thermal fatigue in soldered electronic assemblies
[DE86-008779] N86-30952

SOLENOIDS
Robot-assisted torque measurement
[DE86-009129] N86-31061

SOLID PROPELLANT COMBUSTION
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809

SOLID PROPELLANT IGNITION
Evaluation of igniter compositions SR371C and SR44
[AD-A167007] N86-30810

SOLID PROPELLANT ROCKET ENGINES
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809

SOLID ROCKET PROPELLANTS
Descriptive characterization of solid ingredients
[AD-A166874] N86-30885

SOLID STATE DEVICES
Basic research in electronics (JSEP)
[AD-A166075] N86-30936
Heterojunction D(-) (or a(+)) millimeter and submillimeter wave detector
[AD-D012309] N86-31388

SOLID STATE LASERS
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381

SOLIDIFICATION
Sensitivity analysis of a numerically simulated HgCdTe solidification process by statistical methods
[DE86-007935] N86-30647
Approximate analysis of the formation of a buoyant solid sphere in a supercooled melt
[DE86-007882] N86-31022
Mathematical modeling of laser induced ultrarapid melting and solidification
[DE86-008482] N86-31047
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380

SOLIDS
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017

SOLUBILITY
Phase relations and miscibility in polymer blends containing copolymers
[AD-A166773] N86-30888

SORBENTS
Space station molecular sieve development
[NASA-CR-178885] N86-30864

SOUND WAVES
Problems in nonlinear acoustics: Parametric receiving arrays, focused finite amplitude sound and dispersive nonlinear interactions
[AD-A167311] N86-31343
Surface acoustic wave dust-deposition sensor
[DE86-001068] N86-31345

SOUNDING
Bistatic phase sounding in the ionosphere above the Minor Scale explosion
[DE86-008582] N86-31176

SOUNDING ROCKETS
Active plasma release experiments
[NASA-CR-176897] N86-31462
A magnetospheric critical velocity experiment: Particle results N86-31463

SPACE ADAPTATION SYNDROME
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
Analysis of nystagmus response to a pseudorandom velocity input N86-31426
Flow cytometry analysis of hormone receptors on human peripheral blood mononuclear cells to identify stress-induced neuroendocrine effects N86-31428
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436

SPACE CHARGE
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802

One dimensional models for relativistic electron beam diode design
[AD-A165953] N86-30934

SPACE COMMERCIALIZATION
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744
National Aeronautics and Space Administration N86-31450
Spinoff 1985
[NASA-TM-89240] N86-31451

SPACE COMMUNICATION
Intersatellite link design issues
[AD-A166761] N86-30904

SPACE ENVIRONMENT SIMULATION
Vibration qualification at the David Florida Laboratory — spacecraft N86-30687
Holographic interferometry for distortion measurements of antennas N86-30776
Low level radiation testing of microelectronic components. Part 2: Preliminary studies of gamma dose rate effects on CMOS inverters, using the LORAD facility
[AERE-R-11679-PT-2] N86-30957

SPACE EXPLORATION
Astronautics and aeronautics, 1977: A chronology
[NASA-SP-4022] N86-31524

SPACE MISSIONS
Estimated burst power requirements for selected SDI missions
[DE86-005438] N86-30955
Astronautics and aeronautics, 1977: A chronology
[NASA-SP-4022] N86-31524

SPACE PERCEPTION
Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217

SPACE PLASMAS
Activities report of the Ionospheric Observatory
[UIO-SR-86-01] N86-31179
Activities report of the Geophysical Institute
[ISSN-0283-1686] N86-31460

SPACE SHUTTLE BOOSTERS
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809

SPACE SHUTTLE MAIN ENGINE
Adaptive computational methods for SSME internal flow analysis
[NASA-CR-178864] N86-30959
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold
[NASA-CR-178868] N86-30961

SPACE SHUTTLE MISSION 41-G
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g
[AD-A167142] N86-31205

SPACE SHUTTLE PAYLOADS
Significance and reliability of dynamic analysis methods demonstrated in the Instrument Pointing System project — Space Shuttle payload N86-30689
Observations of the Earth's magnetic field from the shuttle: Using the Spartan carrier as a magnetic survey tool
[NASA-TM-87796] N86-30755
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790

SPACE SHUTTLES
The Association of Schools of Journalism and mass communication journalist-in-space project
[NASA-CR-176961] N86-30743
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30756
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
Application of computer image enhancement techniques to shuttle hand-held photography N86-31416
National Aeronautics and Space Administration N86-31450

SPACE STATION POWER SUPPLIES
An IBM PC-based math model for space station solar array simulation N86-31418

SPACE STATIONS
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
Evaluating space station applications of automation and robotics technologies from a human productivity point of view N86-31412
Investigation of local area networks for an orbiting space station N86-31417
Engineering graphics data entry for space station data base N86-31425
Materials considerations in the design of a metal-hydride heat pump for an advanced extravehicular mobility unit N86-31427
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431
CSTAR star catalogue development N86-31434

SPACE TRANSPORTATION
A study of factors related to commercial space platform services
[NASA-CR-176881] N86-30744

SPACE TRANSPORTATION SYSTEM
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933
National Aeronautics and Space Administration N86-31450

SPACE TRANSPORTATION SYSTEM FLIGHTS
Lateral stability and control derivatives extracted from five early flights of the space shuttle Columbia
[NASA-TM-88994] N86-30756

SPACE-TIME FUNCTIONS
Space-time processing for weak signal detection in non-Gaussian and nonuniform electromagnetic interference (EMI) fields
[PB86-193406] N86-30929

SPACEBORNE PHOTOGRAPHY
Application of computer image enhancement techniques to shuttle hand-held photography N86-31416

SPACEBORNE TELESCOPES
High-stability telescope structures — spaceborne telescopes N86-30773
Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems — spaceborne telescopes N86-30795

SPACECRAFT ANTENNAS
Hygrothermal characteristics of antenna materials — spacecraft antennas N86-30780
Thermal stability of sandwich reflectors — spacecraft antennas N86-30774
Holographic interferometry for distortion measurements of antennas N86-30776
Development of an antenna structure for a deployable offset antenna N86-30797
Structural analysis, manufacturing and test evaluation of a polarization sensitive reflector N86-30798

SPACECRAFT CABIN ATMOSPHERES
In vitro cytogenetic studies of organic chemicals found as contaminants in spacecraft cabin atmospheres N86-31433

SPACECRAFT COMMUNICATION
Development of a small Multifunctional Ground Station (MGS) for satellite communication on 11/14 GHz
[ESA-86-97314] N86-30923
Propagation research of a satellite communication path at the Technical University, Eindhoven (The Netherlands) using OTS: Modeling and measurements
[ESA-86-97316] N86-30925

SPACECRAFT COMPONENTS
Design, fabricate and test Spacecraft Automatic Active Discharge System (SAADS)
[AD-A166559] N86-30802
JPL preferred parts list: Reliable electronic components
[NASA-CR-176258] N86-30689
Low temperature rate controller
[AD-D012277] N86-31052

SPACECRAFT CONSTRUCTION MATERIALS
Proceedings of a Workshop on Composites Design for Space Applications — conference
[ESA-SP-243] N86-30758
The application of composites to space structures: Guidelines on important aspects for the designer N86-30759
Fatigue and damage in fibre reinforced nylon N86-30761
Thermal residual stresses in symmetric and unsymmetric carbon fiber reinforced plastics: Some tentative ways of evaluation N86-30762
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763
Damping of composites N86-30764
The strength of bolted joints in Kevlar RP — reinforced plastic (RP) N86-30765
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780

SPACECRAFT CONTAMINATION
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409
In vitro cytogenetic studies of organic chemicals found as contaminants in spacecraft cabin atmospheres N86-31433

SPACECRAFT CONTROL
Stiffness control of large space structures N86-30652
Aspects of active isolation as applied to a satellite structure with shape precision payload N86-30653
Application of the LQG/LTR technique to robust controller synthesis for a large flexible space antenna
[NASA-TP-2580] N86-30800
Control of large flexible systems by spatial modal input-distribution control
[AD-A166912] N86-30803
Modeling and analysis of pinhole occulter experiment
[NASA-CR-178875] N86-30807

SPACECRAFT DESIGN
Spacecraft structures design and verification N86-30685
Geopotential research mission, science, engineering and program summary
[NASA-TM-86240] N86-31090

SPACECRAFT ENVIRONMENTS
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409

SPACECRAFT LAUNCHING
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30688
New prediction methods for composites hygrothermal behavior N86-30771

SPACECRAFT MODELS
Analysis-test correlation of dynamic mathematical models — spacecraft structures N86-30680
Test and analysis correlation for structural dynamic systems — spacecraft structures N86-30682
Dynamic verification of very large space structures N86-30683
Control of large flexible systems by spatial modal input-distribution control
[AD-A166912] N86-30803

SPACECRAFT PERFORMANCE
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30688

SPACECRAFT POWER SUPPLIES
Design and development of the Advanced Rigid Array (ARA) solar panel — composite structures N86-30796
Estimated burst power requirements for selected SDI missions
[DE86-005438] N86-30955
Space power using solar photovoltaic panels: Costs and limitations
[DE86-008953] N86-31105
Development of a simulation code for a latent heat thermal energy storage system in a space station
[DE86-010070] N86-31113

SPACECRAFT PROPULSION
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

SPACECRAFT REENTRY
Review and analysis of high temperature chemical reactions and the effect of non-equilibrium conditions N86-31423

SPACECRAFT SHIELDING
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31086

SPACECRAFT STRUCTURES
Structural optimization with constraints in dynamics — spacecraft design N86-30658
Modal parameters estimation from driven-base tests — spacecraft structures N86-30672
Analysis-test correlation of dynamic mathematical models — spacecraft structures N86-30680
Test and analysis correlation for structural dynamic systems — spacecraft structures N86-30682
Reconstruction of forcing functions based on measured structural responses N86-30684
Spacecraft structures design and verification N86-30685
Vibration qualification at the David Florida Laboratory — spacecraft N86-30687
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30688
Proceedings of a Workshop on Composites Design for Space Applications — conference
[ESA-SP-243] N86-30758
The application of composites to space structures: Guidelines on important aspects for the designer N86-30759
New prediction methods for composites hygrothermal behavior N86-30771
Dimensional stability of CFRP tubes for space structures N86-30775
Delamination fracture toughness of composite spacecraft structures N86-30777

On the defect sensitivity of spacecraft typical thin CFRP laminates N86-30782
Integrity of carbon fiber reinforced plastics. Structural elements, screening procedures, opportunities and open issues — spacecraft structures N86-30783
Increasing use of composite structure on Ariane launchers N86-30786
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
The development of the Ariane 4 SPELDA — Double-launch external structure (spelda) N86-30788
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790
On the development of a corrugated CFRP central cylinder for satellites N86-30791
A step towards an ESA composites design handbook for space structure applications N86-30799
Winding with thermoplastic polymers — spacecraft structures
[SNIAS-861-430-106] N86-30804

SPACECRAFT TRAJECTORIES
Low-thrust rocket trajectories
[DE86-007573] N86-30754

SPACECREWS
Cytogenetic analyses of peripheral lymphocytes subjected to simulated solar flare radiation N86-31431

SPACELAB PAYLOADS
Remote Science Operation Center research
[NASA-CR-176869] N86-30746

SPALLATION
Galactic cosmic ray composition N86-31492

SPANWISE BLOWING
International Aviation (selected articles)
[AD-A166748] N86-30690

SPARK GAPS
Gas mixture for triggerable spark gaps
[AD-D012289] N86-30946

SPARK IGNITION
Modeling and diagnostics of combustion in spark-ignition engines
[DE86-008173] N86-30826

SPATIAL RESOLUTION
Techniques for optical interferanemography
[AD-A165950] N86-31359

SPECIFICATIONS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714
Defining reclaimed water potability requirements N86-31422

SPECTRAL BANDS
Laser spectroscopy of ozone
[AD-A166516] N86-30820

SPECTRAL METHODS
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007

SPECTROGRAPHS
Development of low-energy X-ray spectrograph system
[AD-A166195] N86-31347

SPECTROMETERS
Investigation of optical damage via resonance ionization mass spectrometry
[DE86-007369] N86-31045
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358

SPECTROSCOPY
Laser spectroscopy of ozone
[AD-A166516] N86-30820
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
Mossbauer spectroscopy of extraterrestrial materials N86-31410

SPECTRUM ANALYSIS
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007269] N86-30735
Emulsion chamber observations and interpretation (HE 3) N86-31499

SPEECH RECOGNITION
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Advanced architectures for digital signal processors
[AD-A166921] N86-30905
A Low-Data-Rate Voice Transmission System (LDRVTS) for HF communication
[AD-A166946] N86-30906

SPHERICAL COORDINATES
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006

SPRAYING
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960

SPUTTERING
Assessment of the application of the sputtering process to beryllium for hardening optical coatings
[DE86-006656] N86-30872
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-008791] N86-31398

STABILITY
Topography, stresses, and stability at Yucca Mountain, Nevada
[DE86-008247] N86-31174
Effects of stiffness
[DE86-009559] N86-31293

STABILITY TESTS
Behavior of turbine wheel gas counters at high pressures N86-30975
Primary measurement — gas flow N86-30976
Monte Carlo stability analysis of strained layer superlattice interfaces
[DE86-007146] N86-31390

STACKING FAULT ENERGY
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376

STAINLESS STEELS
Microstructural effects in solid-particle erosion
[DE86-008211] N86-30815
Study of the polarization for Incoloy 800 and for the stainless steel AISI 304 in mixtures of iron, nickel and chromium chlorides
[DE86-701576] N86-30858
Properties of point defects in metals and alloys
[DE86-780413] N86-30860

STANDARDS
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] N86-30711
The prospects for finite element analysis methods for structural qualification
[AGARD-R-736] N86-31083

STAR DISTRIBUTION
CSTAR star catalogue development N86-31434

STAR TRACKERS
CSTAR star catalogue development N86-31434

STARS
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31468
Magnetic fields of cosmic bodies
[DE86-701119] N86-31476

STATIC AERODYNAMIC CHARACTERISTICS
Static aeroelastic analysis using aircraft vibration modes N86-30641

STATIC ELECTRICITY
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30706

STATIC PRESSURE
Measurement of small pressure differences at a high static pressure — gas flow N86-30977

STATISTICAL ANALYSIS
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
All subsets regression in Cox model
[AD-A166897] N86-31310
Central limit theorem for variable size simple random sampling from a finite population
[DE86-007092] N86-31312
Deterministic sensitivity theory for nonlinear systems: The forward and the adjoint method
[DE86-009512] N86-31318
Sieves for Gaussian processes
[AD-A166055] N86-31319

STATISTICAL CORRELATION
Analysis-test correlation of dynamic mathematical models — spacecraft structures N86-30680

STATISTICAL DISTRIBUTIONS
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166998] N86-31209
Extreme point methods in the determination of the structure of a class of bivariate distributions and some applications to contingency tables
[AD-A167230] N86-31285

STATISTICAL TESTS
Testing and combination of confidence ellipses: A geometric analysis
[NASA-CR-176967] N86-31308

STEADY FLOW
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632

STEELS
Study of settling of metalized sinter in reducing atmosphere
[BLL-M-36597-(5828.4)] N86-30836
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31062

STELLAR ENVELOPES
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466

STELLAR EVOLUTION
Observations of far-infrared molecular emission lines from the Orion molecular cloud
[NASA-CR-176876] N86-31466

STELLAR MASS ACCRETION
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477

STELLAR MASS EJECTION
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477
Extragalactic astronomy N86-31489

STELLAR RADIATION
Support of the balloon-borne ultraviolet stellar spectrograph
[NASA-CR-177152] N86-31031

STELLAR SPECTRA
EX-111 thermal emission from hot white dwarfs: The suggested He abundance-temperature correlation. EX-112: The unique emission line white dwarf star GD 356
[NASA-CR-176866] N86-31470

STIFFNESS
Stiffness control of large space structures N86-30652
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-176135] N86-31273
Effects of stiffness
[DE86-009559] N86-31293

STIFFNESS MATRIX
Parallel solution of linear systems with striped sparse matrices. Part 2. Stiffness matrices, A case study
[AD-A166047] N86-31278

STIRLING CYCLE
Evaluation of a Stirling engine heater bypass with the NASA Lewis nodal-analysis performance code
[NASA-CR-179460] N86-31452

STOCHASTIC PROCESSES
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268
Optimum parameter identification in a dynamic system described by a stochastic linear differential equation with control functions
[ESA-86-97260] N86-31272
Homoclinic phenomena in the gravitational collapse
[DE86-700671] N86-31472

STORAGE BATTERIES
Electrolyte for use in high energy lithium based rechargeable electrochemical cell and rechargeable electrochemical cell including the electrolyte
[AD-D012310] N86-31100

STORAGE TANKS
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863

STORMS
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166899] N86-31200
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203

Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

STORMS (METEOROLOGY)
Severe local storm warning verification preliminary procedures
[PB86-194362] N86-31195

STRAIN ENERGY METHODS
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071

STRAIN HARDENING
Dynamic recrystallization during high temperature low cycle fatigue of nickel
[DE86-009010] N86-30855

STRAIN RATE
The effects of strain heating in lithospheric stretching models N86-31163

STRATOSPHERE
Ground based ozone measurements in an equatorial rainforest
[INPE-3858-PRE-922] N86-31115
Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166561] N86-31166

STREAMS
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203

STRESS (PHYSIOLOGY)
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211

STRESS ANALYSIS
Industrial calculation of damage tolerance and stress allowables in components made of composite materials using the PAM-FISS/biphase material model N86-30779
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014
Stress analysis of the cracked lap shear specimens: An ASTM round robin
[NASA-TM-89006] N86-31071
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
Development and application of the P-version of the finite element method
[AD-A166056] N86-31279

STRESS CONCENTRATION
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075

STRESS CORROSION
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753

STRESS CORROSION CRACKING
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations
[DE86-008907] N86-30853

STRESS INTENSITY FACTORS
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075

STRESS RELAXATION
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880

STRESS-STRAIN RELATIONSHIPS
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080

STRESSES
Predicting bore deformations and launcher stresses in railguns
[DE86-008738] N86-30751
The effect of baking and stress on the hydrogen content of cadmium plated high strength steels
[AD-A166869] N86-30843
Topography, stresses, and stability at Yucca Mountain, Nevada
[DE86-008247] N86-31174

STRIATION
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170

STRING THEORY
Experimental and theoretical high energy physics
[DE86-009052] N86-31356

STROBOSCOPES
Sensitivity to visual motion in statistically defined displays
[AD-A167291] N86-31217

STRONG INTERACTIONS (FIELD THEORY)
Elementary particle physics N86-31487

STROUHAL NUMBER
Influence of the form of the vortex bodies on the technical performance of a vortex meter N86-30978

STRUCTURAL ANALYSIS
Predicting bore deformations and launcher stresses in railguns
[DE86-008738] N86-30751
Orthotropic properties of layered fiber composites N86-30766
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
Developments in the nondestructive evaluation (NDE) of composite materials N86-30785
Structural analysis, manufacturing and test evaluation of a polarization sensitive reflector N86-30798
Improved structural polymer alloys and composites
[AD-A166150] N86-30866
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
A new efficient approach to the formulation of mixed finite element models for structural analysis
[AD-A167340] N86-31077
The prospects for finite element analysis methods for structural qualification
[AGARD-R-736] N86-31083
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170

STRUCTURAL BASINS
Evolution of basin and range structure in the Ruby Mountains and vicinity, Nevada N86-31124
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31128
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

STRUCTURAL DESIGN
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing N86-30654
Structural optimization programs and methods — aircraft weight reduction N86-30655
Variation of anisotropic behavior in structural optimization — aircraft composite structures N86-30656
Structural optimization with constraints in dynamics — spacecraft design N86-30658
Effects of anisotropic design on the static aeroelasticity of a swept wing — aeroelastic tailoring N86-30661
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] N86-30719
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Launcher barrel for the lethality test system railgun
[DE86-008739] N86-30750
Proceedings of a Workshop on Composites Design for Space Applications — conference
[ESA-SP-243] N86-30758
The application of composites to space structures: Guidelines on important aspects for the designer N86-30759
Design and manufacturing aspects of space trusses N86-30772
High-stability telescope structures — spaceborne telescopes N86-30773
Integrity of carbon fiber reinforced plastics. Structural elements, screening procedures, opportunities and open issues — spacecraft structures N86-30783
Development of the Ariane 4 interstage 2-3 in CFRP N86-30787
The development of the Ariane 4 SPELDA — Double-launch external structure (speida) N86-30788
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790
Comparison of classical and cocuring manufacturing techniques for a CFRP honeycomb central tube — satellite central tube N86-30792
Design and development of the Advanced Rigid Array (ARA) solar panel — composite structures N86-30798
A step towards an ESA composites design handbook for space structure applications N86-30799
Experimental measurement of ablation effects in plasma armature railguns
[DE86-008740] N86-30860
High accuracy fuel flowmeter
[NASA-CR-174869] N86-31030
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] N86-31335
Development of low-energy X-ray spectrograph system
[AD-A166195] N86-31347
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358
Reversed field pinch: Present status to future potential
[DE86-006026] N86-31372

STRUCTURAL DESIGN CRITERIA
Aerodynamic drag reduction tests on a box-shaped vehicle
[NASA-CR-176982] N86-30692
System performance analysis of stretched membrane heliostats
[DE85-016885] N86-31101

STRUCTURAL ENGINEERING
Spacecraft structures design and verification N86-30695
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867

STRUCTURAL PROPERTIES (GEOLOGY)
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30909
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119

STRUCTURAL RELIABILITY
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
Needs assessment for nondestructive testing and materials characterization for improved reliability in structural ceramics for heat engines
[DE86-010039] N86-30881

STRUCTURAL STABILITY
Stiffness control of large space structures N86-30662
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] N86-30721
Institute for Materials Science and Engineering, Ceramics: Technical activities, 1985
[PB86-196771] N86-30892
Dynamic response of random parameterized structures with random excitation
[DE86-007246] N86-31078
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31082

STRUCTURAL VIBRATION
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique N86-30678
Modified US Army U-8F ground vibration test [NASA-TM-86741] N86-30723
STRUTS
Strength of carbon fiber composite/titanium bonded joints as used for SPAS-type structures N86-30794
SUBMERGING
Evaluation of the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium [DE86-701579] N86-30859
SUBMILLIMETER WAVES
Heterojunction Di(-) (or a(+)) millimeter and submillimeter wave detector [AD-D012309] N86-31388
SUBROUTINES
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide [AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0) [DE86-009083] N86-31256
Package for solving large sparse systems of stiff ordinary differential equations [DE86-009545] N86-31292
SUBSONIC FLOW
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
Application of unsteady wing collocation methods to cascades in subsonic flow N86-30636
A semi-analytical approach to the integral equation (in terms of the acceleration potential) for the linearized subsonic, oscillatory flow over an airfoil [AD-A167313] N86-30701
Viscous flow computations for elliptical two-duct version of the SSME hot gas manifold [NASA-CR-178868] N86-30961
SUBSONIC FLUTTER
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model N86-30649
SUBSTRATES
Characteristic impedance of a wide slot line on low permittivity substrates N86-30893
SUDDEN IONOSPHERIC DISTURBANCES
Solar-Geophysical Data Number 497, January 1986. Part 1: (Prompt reports). Data for December 1985, November 1985 and late data [NASA-CR-177170] N86-31181
SULFATES
Chemical instrumentation for field studies of atmospheric wet deposition processes [DE86-005255] N86-31175
SULFUR COMPOUNDS
Fuel component and heteroatom effects on deposits and wear [AD-A166839] N86-31051
SULFUR DIOXIDES
Acid deposition: A national problem [DE86-007810] N86-31117
SUMMARIES
AFOSR (Air Force Office of Scientific Research) technical report summaries [AD-A166142] N86-31453
SUN
Oceanographic analysis of sun glint images taken on space shuttle mission STS 41-g [AD-A167142] N86-31205
Particle acceleration by the sun N86-31494
Coronal and interplanetary propagation, interplanetary acceleration, cosmic-ray observations by deep space network and anomalous component N86-31495
SUPERCONDUCTIVITY
AE monitoring instrumentation for high performance superconducting dipoles and quadrupoles, Phase 2 [DE86-007414] N86-31035
Basic studies of submicron layers of Nb-Al [DE86-006985] N86-31389
SUPERCRITICAL AIRFOILS
The method of complex characteristics for design of transonic blade sections [NASA-CR-178978] N86-30691
SUPERCRITICAL FLUIDS
Transport and relaxation processes in supercritical fluids [DE86-008329] N86-31023
SUPERGRAVITY
Effective potential in N=1, d=4 supergravity coupled to the Volkov-Akulov field [DE86-700634] N86-31475
SUPERHIGH FREQUENCIES
The X-SAR science team — SIR-C N86-31085
Principle of SAR and X-SAR performance. The X-SAR/SIR-C mission. Some remarks concerning organization aspects N86-31086
Geology — X-SAR/SIR-C mission N86-31088
Hydrology — X-SAR/SIR-C mission N86-31089
Oceanography — X-SAR/SIR-C mission N86-31090
Ice and snow — X-SAR/SIC-C mission N86-31091
Vegetation — X-SAR/SIR-C mission N86-31092
SUPERLATTICES
Theoretical and material studies on thin-film electroluminescent devices [NASA-CR-177150] N86-30932
Monte Carlo stability analysis of strained layer superlattice interfaces [DE86-007146] N86-31390
SUPERNOVA REMNANTS
Diffusive electron acceleration at SNR shock fronts and the observed SNR radio spectral indices N86-31520
SUPERNOVAE
Extragalactic astronomy N86-31489
SUPERSONIC FLOW
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow N86-30633
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field N86-30634
SUPERSYMMETRY
Experimental and theoretical high energy physics [DE86-009052] N86-31356
Effective potential in N=1, d=4 supergravity coupled to the Volkov-Akulov field [DE86-700634] N86-31475
SUPPORTS
Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems — spaceborne telescopes N86-30795
Determination of optimum mounting configurations for flat-plate photovoltaic modules based on a structured field experiment and simulated results from PVFORM, a photovoltaic system performance model [DE86-009539] N86-31110
SURFACE ACOUSTIC WAVE DEVICES
Surface acoustic wave dust-deposition sensor [DE86-001068] N86-31345
SURFACE DEFECTS
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers [AD-A166864] N86-31362
SURFACE LAYERS
Effect of surface corrosion on glass fracture [DE86-006404] N86-30876
SURFACE PROPERTIES
Pulsed laser and ion beam surface modification of sintered alpha-SiC [DE86-008978] N86-30816
Basic considerations on surface optical nonlinearities [DE86-008378] N86-31365
SURFACE REACTIONS
Reactions of organic molecules on transition metal surfaces [AD-A166214] N86-30819
Computer simulation of surface and film processes [NASA-CR-178966] N86-31377
Reactions of laser-generated free radicals at semiconductor surfaces [AD-A166233] N86-31379
SURFACE ROUGHNESS
Effects of surface microroughness in ellipsometry [DE86-008014] N86-31364
Thermal and electrical contact conductance studies [NASA-CR-177093] N86-31378
SURFACE ROUGHNESS EFFECTS
Simulation of aircraft taxi testing on the AGILE shaker test facility N86-30663
SURFACE TEMPERATURE
Chloride stress corrosion cracking of insulated austenitic stainless steel: Solar heating considerations [DE86-008907] N86-30853
Application of solar max ACRIM data to analyze solar-driven climatic variability on Earth [NASA-CR-178955] N86-31183
SURFACE VEHICLES
Geographic information systems in robotic vehicles [AD-A166859] N86-31053
SURFACE WATER
Acid deposition: A national problem [DE86-007810] N86-31117
SURFACE WAVES
Interactions between ocean surface waves and currents [AD-A166888] N86-31199
Surface acoustic wave dust-deposition sensor [DE86-001068] N86-31345
SURFACES
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field N86-30634
SURVEILLANCE
Design, development and integrate/install an airborne remote instrumentation system (AIREYE) [AD-A166755] N86-30728
SWELLING
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
SWEPT FORWARD WINGS
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing N86-30654
Effects of anisotropic design on the static aeroelasticity of a swept wing — aeroelastic tailoring N86-30661
SWEPT WINGS
Three-dimensional shock wave and turbulent boundary layer interactions [AD-A167066] N86-31010
SWITCHING CIRCUITS
Diffuse discharge switch analysis [AD-A167282] N86-30945
Space-variant optical systems [AD-A167275] N86-31362
SYMMETRY
The Hopf algebra of symmetric functions [IR-250] N86-31325
Concerning the transformation behavior of fields under the superconformal symmetries [DE86-009008] N86-31407
SYNCHRONISM
Synchronizer failure in A/D converters [AD-A166819] N86-30942
A high-speed asynchronous communication technique for MOS (Metal-Oxide-Semiconductor) VLSI systems [AD-A166846] N86-30943
SYNCHRONIZERS
Synchronizer failure in A/D converters [AD-A166819] N86-30942
SYNTAX
Representation for closed form significance testing in VL1 N86-31219
SYNTHESIS (CHEMISTRY)
Chemistry Research Resource [DE86-008765] N86-30811
Space station molecular sieve development [NASA-CR-178885] N86-30864
Design and chemical synthesis of iodine-containing molecules for application to solar-pumped I* lasers [NASA-CR-178854] N86-31037
SYNTHETIC APERTURE RADAR
A model description for radar reflection on the sea surface 2 [ESA-86-97553] N86-30928
The X-SAR science plan — SIR-C [DFVLR-MITT-85-17] N86-31084
The X-SAR science team — SIR-C N86-31085
Principle of SAR and X-SAR performance. The X-SAR/SIR-C mission. Some remarks concerning organization aspects N86-31086
Radar technology — X-SAR/SIR-C mission N86-31087
Geology — X-SAR/SIR-C mission N86-31088
Hydrology — X-SAR/SIR-C mission N86-31089
Oceanography — X-SAR/SIR-C mission N86-31090
Ice and snow — X-SAR/SIC-C mission N86-31091
Vegetation — X-SAR/SIR-C mission N86-31092
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments [NASA-CR-171931] N83-31409
Distributed synthetic aperture radar simulation N86-31413
SYSTEM FAILURES
Robust detection, isolation and accommodation for sensor failures [NASA-CR-174825] N86-30732
Broadcasting topology and routing information in computer networks [AD-A166863] N86-31262
SYSTEM IDENTIFICATION
Determination of both complex characteristic structural values and normal mode parameters from harmonic excitation near resonance N86-30668
Simultaneous determination of normal eigenmodes and generalized damping matrix from complex eigenmodes N86-30670
Identification and dynamic condensation of physical system matrices using incomplete dynamic response data N86-30671
Advances in time domain modal identification and modeling of structures N86-30676

Comparison of some time domain methods for structural system identification N86-30677
System Identification. Mini course
[ER-84/02] N86-31274
On the coherence among the multitude of system identification methods N86-31275
A generalized diagram for various parameter estimation methods; the coherence in pseudo-linear regression schemes N86-31276

SYSTEMS ANALYSIS
Finite state modelling of aeroelastic systems for active control applications: A general theory N86-30648
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Basic human factors considerations
[DE86-008181] N86-31223
Sequential and parallel matrix computations
[AD-A166062] N86-31320

SYSTEMS ENGINEERING
A design study for the use of a multiple aperture deployable antenna for soil moisture remote sensing satellite applications
[NASA-CR-178154] N86-30933
A coherent VLSI design environment
[AD-A166848] N86-30944
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31068
Ada (trade name) training curriculum. Basic Ada programming I202 teacher's guide, volume 1
[AD-A166366] N86-31239

SYSTEMS SIMULATION
Dynamic verification of very large space structures N86-30683

T

TAILLESS AIRCRAFT
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane N86-30662

TARGETS
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914

TASKS
Basic human factors considerations
[DE86-008181] N86-31223
Process of task analysis
[DE86-008183] N86-31225
Ada (trade name) training curriculum. Real-time systems in Ada I401 teacher's guide, volume 1
[AD-A166351] N86-31230

TAXIING
Simulation of aircraft taxi testing on the AGILE shaker test facility N86-30663

TEARING
Effective tearing modulus: A model for brittle fracture and tearing instability
[DE86-008785] N86-31082

TECHNOLOGIES
The Department of Defense statement on science in the mission agencies and federal laboratories before the Task Force on Science Policy of the Committee on Science and Technology of the United States House of Representatives, 99th Congress, first session
[AD-A166041] N86-31438
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439

TECHNOLOGY ASSESSMENT
Developments in the nondestructive evaluation (NDE) of composite materials N86-30785
Comparison of classical and coculring manufacturing techniques for a CFRP honeycomb central tube — satellite central tube N86-30792
Testability measures on a state-of-the-art circuit
[AD-A165978] N86-30935
Radar technology — X-SAR/SIR-C mission N86-31087
Wisconsin Electric and Hybrid Vehicle Demonstration Project
[DE86-009318] N86-31457

TECHNOLOGY TRANSFER
Free-electron lasers for strategic defense: The benefits of scientific open scientific exchange
[DE86-008033] N86-31046
Spinoff 1985
[NASA-TM-89240] N86-31451

TECHNOLOGY UTILIZATION
Increasing use of composite structure on Ariane launchers N86-30786
Magnetostatic wave application to microwave analog signal processing N86-30897
Spinoff 1985
[NASA-TM-89240] N86-31451

TECTONICS
Papers presented to the Conference on Heat and Detachment in Crustal Extension on Continents and Planets
[NASA-CR-176837] N86-31119
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31125
Extensional tectonics and collapse structures in the Suez Rift (Egypt) N86-31129
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
Io: Mountains and crustal extension N86-31135
Heat and detachment in core-complex extension N86-31139
Heat flow increase following the rise of mantle isotherms and crustal thinning N86-31140
Relations between extensional tectonics and magmatism within the Southern Oklahoma aulacogen N86-31141
Hot-spot tectonics on Io N86-31142
The evolution of rifting process in the tectonic history of the Earth N86-31145
Extensional tectonics of the Saturnian Satellites N86-31146
Thermal control of the style of extensional tectonics N86-31148
Extensional tectonics on continents and the transport of heat and matter N86-31149
Low-angle normal faulting and isostatic response in the Gulf of Suez: Evidence from seismic interpretation and geometric reconstruction N86-31152
The relationship of extensional and compressional tectonics to a Precambrian fracture system in the eastern overthrust belt, USA N86-31153
Low-angle normal faults-low differential stress at mid crustal levels N86-31154
Late Precambrian aulacogens of the North China craton N86-31155
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
Heat flow and thermal processes in the Jornada delMuerto, New Mexico N86-31157
Cenozoic extension and magmatism in Arizona N86-31158
Kinematics of a large-scale intraplate extending lithosphere: The Basin-Range N86-31160
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162
Geometry of miocene extensional deformation, lower Colorado River Region, Southeastern California and Southwestern Arizona: Evidence for the presence of a regional low-angle normal fault N86-31164
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

TELECOMMUNICATION
A GaAs based digital serial communications system
[AD-A166060] N86-30900
A high-speed asynchronous communication technique for MOS (Metal-Oxide-Semiconductor) VLSI systems
[AD-A166846] N86-30943

TELECONNECTIONS (METEOROLOGY)
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187

TELEOPERATORS
Duty cycle testing and performance evaluation of the SM-229 teleoperator
[DE86-004780] N86-31059

TELEPHONY
Development of a small Multifunctional Ground Station (MGS) for satellite communication on 11/14 GHz
[ESA-88-97314] N86-30923

TEMPERATURE
Using temperature-programmed reaction for kinetic analysis of reactions in dilute aqueous solutions at high pressure
[DE86-003683] N86-30827

TEMPERATURE EFFECTS
Plasticity and stress relaxation in fracture mechanics test of copper and cupronickel
[DE86-009425] N86-30857
Oil hydraulics in Arctic regions
[DE86-751569] N86-31080
Proceedings of the High-Efficiency Photovoltaic Subcontractor's Review Meeting
[DE86-004415] N86-31106
Thermal control of the style of extensional tectonics N86-31148

TEMPERATURE GRADIENTS
Unique solution to a nonlinear ordinary differential equation
[DE86-005236] N86-31288

TEMPERATURE MEASUREMENT
Thermal history of a metamorphic core complex N86-31132
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189

TEMPERATURE MEASURING INSTRUMENTS
Potassium instrumentation and experiments on potassium vapor
[OEFZS-4328] N86-30834

TEMPERATURE PROFILES
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Lithospheric strength of Ganymede: Clues to early thermal profiles from extensional tectonic features N86-31134
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176837] N86-31168

TENDONS
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844

TENSILE PROPERTIES
Effect of manufacturing processes on structural allowables, phase 1
[AD-A166857] N86-30842

TENSILE STRESS
Low-angle normal faults-low differential stress at mid crustal levels N86-31154

TERNARY ALLOYS
Approximate analysis of the formation of a buoyant solid sphere in a supercooled melt
[DE86-007882] N86-31022

TERRAIN
PN velocity beneath Western New Mexico and Eastern Arizona N86-31136

TEST CHAMBERS
Emulsion chamber observations and interpretation (HE 3) N86-31499

TEST FACILITIES
Simulation of aircraft taxi testing on the AGILE shaker test facility N86-30663
Vibration qualification at the David Florida Laboratory — spacecraft N86-30687
Issues in developing a distributed data acquisition and control system
[DE86-005491] N86-31447

TEST STANDS
European Economic Community (EEC) test stand comparison — gas flow measurement N86-30967

THEOREMS
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267

THEORETICAL PHYSICS
Experimental and theoretical high energy physics
[DE86-009052] N86-31356
Research program with no measurement problem
[DE86-006952] N86-31400

THERMAL ANALYSIS
Characterization and analysis of energetic and plastic materials by Thermal Analysis Mass Spectrometry (TA/MS)
[DE86-006140] N86-30825
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401

THERMAL CONDUCTIVITY
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818
Hydrogen storage system
[DE86-006990] N86-30867
Heat flow and continental breakup: The Gulf of Elat (Aqaba) N86-31123
Unique solution to a nonlinear ordinary differential equation
[DE86-005236] N86-31288

Thermal and electrical contact conductance studies
[NASA-CR-177093] N86-31378
THERMAL DISSOCIATION
Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430
THERMAL EXPANSION
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
New prediction methods for composites hygrothermal behavior N86-30771
THERMAL FATIGUE
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
Numerical and experimental study of residual stresses and thermal fatigue in soldered electronic assemblies
[DE86-008779] N86-30952
THERMAL RADIATION
Numerical predictions of railgun performance including the effects of ablation and arc drag
[DE86-008718] N86-31355
THERMAL SHOCK
Megajoule laser glass development
[DE86-006731] N86-30874
THERMAL STABILITY
Thermal stability of sandwich reflectors — spacecraft antennas N86-30774
THERMAL STRESSES
Thermal residual stresses in symmetric and unsymmetric carbon fiber reinforced plastics: Some tentative ways of evaluation N86-30762
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
THERMODYNAMIC CYCLES
Thermally regenerative hydrogen/oxygen fuel cell power cycles N86-31430
THERMODYNAMIC PROPERTIES
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30888
Experiments on binary refrigerant mixtures in heat pumps
[DE86-750845] N86-31015
THERMODYNAMICS
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138
Heat and detachment in core-complex extension N86-31139
Computation of adiabatic flame temperatures and other thermodynamic quantities
[DE86-009388] N86-31408
THERMOELASTICITY
On correlation between thermal stresses, elastic strain energy and debonding in thermally loaded fiber-reinforced composite materials N86-30780
THERMOELECTRIC COOLING
Development of thermoelectric water heating-cooling devices
[AD-A166949] N86-31221
THERMONUCLEAR REACTIONS
Nova outburst modeling and its application to the recurrent nova phenomenon
[DE86-008715] N86-31477
THERMOPLASTIC RESINS
Winding with thermoplastic polymers — spacecraft structures
[SNIAS-861-430-106] N86-30804
THERMOSPHERE
Determination of the thermospheric neutral wind from incoherent scatter radar measurements
[KGI-186] N86-31178
THICKNESS
A numerical study of forced lithospheric thinning N86-31159
THIN FILMS
Ferromagnetic relaxation in ultrathin films of amorphous alloys
[AD-A166727] N86-30840
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
Theoretical and material studies on thin-film electroluminescent devices
[NASA-CR-177150] N86-30932
Development of a thin AGaAs solar cell
[DE86-009544] N86-31112
Structural instabilities, impurities and defects in electronic materials
[AD-A167272] N86-31385
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
THREE DIMENSIONAL BOUNDARY LAYER
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] N86-31010
THREE DIMENSIONAL FLOW
Calculation of three-dimensional transonic potential flows by a field panel method — oscillating wings N86-30629
Introduction to grid generation systems in turbomachinery N86-30993
Turbulent Shear-Layer/Shock-Wave interaction
[AD-A166934] N86-31008
THRUST DISTRIBUTION
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809
THRUST VECTOR CONTROL
International Aviation (selected articles)
[AD-A166748] N86-30690
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
THUNDERSTORMS
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
TIDAL WAVES
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204
TILT ROTOR AIRCRAFT
Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733
TIME DEPENDENCE
Advances in time domain modal identification and modeling of structures N86-30676
Comparison of some time domain methods for structural system identification N86-30677
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880
Implicit time dependent methods for inviscid and viscous compressible flows N86-30987
Einstein's special relativity versus Lorentz's Aether theory
[DE86-700627] N86-31405
TIME LAG
Evaluation of ignitor compositions SR371C and SR44
[AD-A167007] N86-30810
Phase comparison time delay estimation using wideband signals
[AD-A167025] N86-30910
TIME SERIES ANALYSIS
The determination of modulation transfer functions from the 'Noordwijk' radar measurements in 1978 and 1979 — offshore platform
[BCRS-85-02] N86-30921
TITANIUM
Strength of carbon fiber composite/titanium bonded joints as used for SPAS-type structures N86-30794
Zirconia to cast iron brazing for uncooled diesel engines
[DE86-008982] N86-31058
TITANIUM ALLOYS
An interdisciplinary approach to predictive modeling of structural adhesive bonding characterization of chromic acid and anodized Ti-6Al-4V and anodized Ti-6Al-4V single lap bonds to polyphenylquinoxaline
[AD-A166313] N86-30867
TOKAMAK DEVICES
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264
Annual review: April 1984 - March 1985
[ISSN-0547-1567] N86-31370
TOPOGRAPHY
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
Detailed gravity anomalies and sea surface heights derived from GEOS-3/Seasat altimeter data
[AD-A166593] N86-31169
Topography, stresses, and stability at Yucca Mountain, Nevada
[DE86-008247] N86-31174
TOPOLOGY
Broadcasting topology and routing information in computer networks
[AD-A166663] N86-31262
On using multiple inverted trees for parallel updating of graph properties
[AD-A166058] N86-31280
Binary convexities and distributive lattices
[IR-225] N86-31296
Transfinite classification of weakly-infinite dimensional spaces
[IR-276] N86-31306
A method for constructing ordered continua
[IR-240] N86-31324
A separable normal topological group which is not Lindelöef
[IR-252] N86-31326
Function spaces of low Borel complexity
[IR-260] N86-31328
A Dowkes group
[IR-269] N86-31330
On the product of homogeneous spaces
[IR-274] N86-31332
Quasar-galaxy associations with discordant redshifts as a topological effect, Part 1
[DE86-700689] N86-31471
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet
[PB86-188802] N86-31482
TOROIDAL PLASMAS
ZT-P: An advanced air core reversed field pinch prototype
[DE86-007204] N86-31373
TORQUE
Robot-assisted torque measurement
[DE86-009129] N86-31061
TORQUE CONVERTERS
Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733
TORSIONAL STRESS
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070
TOUGHNESS
Analysis of the toughness characteristics of cryogenic 9% nickel steels
[PB86-196144] N86-30863
TOWERS
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] N86-30714
TOXICOLOGY
The prediction of biological activity using molecular connectivity indices
[AD-A166986] N86-31206
TRACE CONTAMINANTS
Theory and operation of the real-time data acquisition system for the NASA-LaRC differential absorption lidar (DIAL)
[NASA-CR-177151] N86-31036
TRAILING EDGES
Ductless acoustical noise attenuator
[AD-D012288] N86-31344
TRAINING ANALYSIS
In-house CAD training: A realistic approach
[DE86-008926] N86-31251
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456
TRAINING DEVICES
Ada (Trade name) curriculum. Basic Ada programming t202 teacher's guide. Laboratory manual and exercises
[AD-A166043] N86-31238
TRAJECTORY OPTIMIZATION
Preliminary study of the use of Laplace and momentum vectors in the determination of interplanetary low thrust trajectories
[ESA-CR(P)-2173] N86-30745
TRANSDUCERS
Directory of Transducer Users, seventh edition
[AD-A167162] N86-30757
TRANSFER FUNCTIONS
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267
Progress in the design of optical fiber sensors for the measurement of pulsed electric currents
[DE86-007831] N86-31367
TRANSFERRING
Tritium gas transfer pump development
[DE86-007164] N86-31056

TRANSFORMATIONS (MATHEMATICS)
On generic points in the Cartesian square of Chacon's transformation
[IR-244] N86-31300
TRANSIENT LOADS
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075
TRANSIENT OSCILLATIONS
Transient excitation of anharmonic adspecies by pulsed laser radiation
[AD-A166308] N86-31038
TRANSISTORS
Fundamental quantum 1/f Noise in ultrasmall semiconductor devices and their optimal design principles
[AD-A166154] N86-30936
Measurement of internal capacitances of integrated circuits
[DE86-006494] N86-30948
TRANSITION FLOW
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
TRANSITION TEMPERATURE
Basic studies of submicron layers of Nb-Al
[DE86-006985] N86-31389
TRANSMITTANCE
A GaAs based digital serial communications system
[AD-A166060] N86-30900
Comparisons of 76Hz transverse and radial magnetic field strength components received in Connecticut
[AD-A166548] N86-30903
TRANSMITTER RECEIVERS
Development of a small Multifunctional Ground Station (MGS) for satellite communication on 11/14 GHz
[ESA-86-97314] N86-30923
TRANSONIC COMPRESSORS
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor
[AD-A166759] N86-30734
TRANSONIC FLOW
Transonic equivalent strip method for aeroelastic applications N86-30628
Calculation of three-dimensional transonic potential flows by a field panel method — oscillating wings N86-30629
Application of transonic unsteady methods for calculation of flutter airloads N86-30630
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
A review of aeroelastic research at the Flight Dynamics Laboratory N86-30642
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] N86-30696
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
TRANSONIC FLUTTER
Transonic equivalent strip method for aeroelastic applications N86-30628
TRANSPORT AIRCRAFT
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] N86-30702
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] N86-30890
TRANSPORT THEORY
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
TREES (MATHEMATICS)
Expected performance of m-solution backtracking
[NASA-CR-178162] N86-31236
TRENDS
Developments and trends in environmental protection
[OEFZS-4342] N86-31118
TRIBOLOGY
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050
TRIGGER CIRCUITS
Gas mixture for triggerable spark gaps
[AD-D012289] N86-30946
TRITIUM
Tritium gas transfer pump development
[DE86-007164] N86-31056
TROPICAL REGIONS
Phase A technical study summary report for a Tropical Earth Resources satellite (TERS)
[JTERS-84-07] N86-31097
Proposal to NIVR for a system definition study of a Tropical Earth Resources Satellite (TERS) — Netherlands Agency for Aerospace Programs (NIVR)
[NTERS-84-11] N86-31098
Parameters determining maximum wind velocity in a tropical cyclone
[DE86-701371] N86-31193
TROPICAL STORMS
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
TROPOSPHERE
Ground based ozone measurements in an equatorial rainforest
[INPE-3858-PRE-922] N86-31115
TROUGHS
Late Precambrian aulacogens of the North China craton N86-31155
TRUNCATION ERRORS
Numerical modeling of Navier-Stokes equations N86-30991
TRUSSES
Design and manufacturing aspects of space trusses N86-30772
Structural inelasticity 28: A finite element vectorization method for the solution of crack growth problems in 2 or 3 dimensions
[AD-A166545] N86-31072
TUNABLE LASERS
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048
TUNGSTEN
Characterization of the impurities in tungsten/silicon-germanium contacts
[DE86-006791] N86-31398
TUNGSTEN COMPOUNDS
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
TUNING
Narrow band tuning with small long pulse excimer lasers
[DE86-007368] N86-31048
TURBINE BLADES
Theoretical flutter investigations on a plane cascade in incompressible flow — axial flow compressors and turbines N86-30635
Application of unsteady wing collocation methods to cascades in subsonic flow N86-30636
TURBINE WHEELS
Dynamic analysis of structures with flexible rotors — aircraft engines N86-30664
Behavior of turbine wheel gas counters at high pressures N86-30975
TURBOCOMPRESSORS
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor
[AD-A166759] N86-30734
TURBOFAN ENGINES
Feasibility study for convertible engine torque converter
[NASA-CR-175082] N86-30733
TURBOJET ENGINES
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] N86-30735
TURBOMACHINE BLADES
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings — conference
[VKI-LS-1986-02] N86-30988
Governing equations — viscous flow in turbomachinery bladings N86-30989
Solution method of parabolized Navier-Stokes equations — turbomachine bladings N86-30990
Turbulence models — turbomachine bladings N86-30992
TURBOMACHINERY
Introduction to grid generation systems in turbomachinery N86-30993
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998
TURBOPROP ENGINES
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] N86-31338
TURBULENCE
Aircraft response to turbulence
[AGARD-R-738] N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] N86-30741
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
Cosmic ray sources, acceleration and propagation N86-31493
TURBULENT BOUNDARY LAYER
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] N86-31010
Bursts and pressure fluctuations in turbulent boundary layers
[AD-A167186] N86-31012
The orientation distribution of nonspherical aerosol particles within a cloud
[AD-A167326] N86-31172
TURBULENT FLOW
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] N86-30731
Sandia Cooperative Group on the aerothermochemistry of turbulent combustion
[DE86-006838] N86-30829
Simulation and modeling of homogeneous, compressed turbulence
[NASA-CR-176939] N86-30958
Turbulence models — turbomachine bladings N86-30992
Equations of laminar and turbulent flows in general curvilinear coordinates
[AD-A166837] N86-31006
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
Turbulent Shear-Layer/Shock-Wave interaction
[AD-A166934] N86-31008
Map models of the transition to turbulence in two and three dimensional pipe flow
[DE86-006842] N86-31013
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
CALTECH-DOE program on numerical analysis, scientific computing and fundamental studies of motion, energy and mass transfer in fluids
[DE86-008369] N86-31021
Chemically reacting turbulent flow
[PB86-196722] N86-31029
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] N86-31357
European Science Notes, volume 40, number 5
[AD-A166882] N86-31455
TURBULENT MIXING
Chemically reacting turbulent flow
[PB86-196722] N86-31029
TURING MACHINES
Finite state modelling of aeroelastic systems for active control applications: A general theory N86-30648
TWO DIMENSIONAL BODIES
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] N86-30986
TWO DIMENSIONAL FLOW
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] N86-30894
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] N86-30731
Ergodicity and mixing in a five-mode spectral model of two-dimensional turbulence
[AD-A166922] N86-31007
Turbulent Shear-Layer/Shock-Wave interaction
[AD-A166934] N86-31008
TWO PHASE FLOW
Void fraction measurement in two-phase flow with X-rays
[DE86-780422] N86-31025
TYPHOONS
Typhoon structural variability
[AD-A166772] N86-31189

U

ULLAGE
An analysis of ullage heat transfer in the orbital refueling system N86-31424
ULTRAVIOLET LASERS
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167087] N86-31040
ULTRAVIOLET RADIATION
Studies of the aurorally-induced ultraviolet emissions on the nightside of Venus
[NASA-CR-177004] N86-31478
ULTRAVIOLET REFLECTION
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31368
ULTRAVIOLET SPECTRA
Laser spectroscopy of ozone
[AD-A166516] N86-30820
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
ULTRAVIOLET SPECTROMETERS
Ultraviolet spectrometer and polarimeter (UVSP) software development and hardware tests for the solar maximum mission
[NASA-CR-177889] N86-30806
Support of the balloon-borne ultraviolet stellar spectrograph
[NASA-CR-177152] N86-31031
ULTRAVIOLET TELESCOPES
Support of the balloon-borne ultraviolet stellar spectrograph
[NASA-CR-177152] N86-31031
UNIFIED FIELD THEORY
Unified model for gravity-electro-weak interactions
[DE86-700688] N86-31474
UNIVERSE
Extragalactic astronomy N86-31489
UNIVERSITIES
Hampton University/American Society for Engineering Education/NASA Summer Faculty Fellowship Program 1986
[NASA-CR-178169] N86-31437
UNSTEADY FLOW
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics N86-30631
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field N86-30634
Application of unsteady wing collocation methods to cascades in subsonic flow N86-30636
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity N86-30636
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-178879] N86-30730
Effects of previous disturbances on the meter factors of a vortex meter N86-30979
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
UPPER ATMOSPHERE
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
URANUS (PLANET)
Existence of undiscovered Uranian satellites
[DE86-008161] N86-31480
URANUS RINGS
Existence of undiscovered Uranian satellites
[DE86-008161] N86-31480
URBAN DEVELOPMENT
Department of Housing and Urban Development-Independent Agencies Appropriations Bill, 1987
[H-REPT-99-731] N86-31449
USER MANUALS (COMPUTER PROGRAMS)
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] N86-30691
Introduction to the CCM modular processor (version PROC01)
[PB86-188679] N86-31196
CCM modular processor users' guide (version PROC01)
[PB86-187069] N86-31197
Cognitive and perceptual principles of window-based computer dialogues
[NASA-CR-176964] N86-31235
LSSOL (Version 1.0): a Fortran package for constrained linear least-squares and convex quadratic programming. User's guide
[AD-A166945] N86-31246
Fortran package for constrained linear least-squares and convex quadratic programming. User's Guide for LSSOL (version 1.0)
[DE86-009083] N86-31256
USER REQUIREMENTS
Making the human-machine interface responsive to many classes of users
[DE86-003453] N86-31222
Integration of an expert system into a user interface language demonstration N86-31432
UTAH
Geometric and chronologic evolution of the Verde and Payson Basins of Central Arizona and possible relationships to detachment faulting N86-31127

V

V/STOL AIRCRAFT
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
VACANCIES (CRYSTAL DEFECTS)
Properties of point defects in metals and alloys
[DE86-780413] N86-30860
VACUUM CHAMBERS
Measurement of rate constants of elementary gas-reactions of importance to upper atmosphere and combustion systems
[AD-A167177] N86-30823
VACUUM MELTING
A mechanical property and stress corrosion evaluation of VIM-ESR-VAR work strengthened and direct double aged Inconel 718 bar material
[NASA-TP-2634] N86-30753
VACUUM SPECTROSCOPY
Reactions of organic molecules on transition metal surfaces
[AD-A166214] N86-30819
VALLEYS
Radial rift and block tectonics around the Tharsis bulge: Introductional postulation N86-31156
VANADIUM ALLOYS
Effect of neutron irradiation on vanadium alloys
[DE86-009156] N86-30851
VAPOR DEPOSITION
SIPOS heterojunction contacts to silicon
[DE86-008879] N86-31399
VAPOR PHASES
Potassium-water reactions in the vapor phase
[OEFZS-4327] N86-30833
Potassium instrumentation and experiments on potassium vapor
[OEFZS-4328] N86-30834
Simulating some statistical features of dusty gas turbulent flow
[DE86-005774] N86-31017
Laser kinetic spectroscopy of unimolecular and bimolecular processes in the gas phase
[AD-A166996] N86-31209
VAPORS
Improved fiber-reinforced SiC composites fabricated by chemical vapor infiltration
[DE86-009530] N86-30814
VARIABLE MASS SYSTEMS
Chemically reacting turbulent flow
[PB86-196722] N86-31029
VARIANCE (STATISTICS)
Variance reduction methods applied to deep-penetration Monte Carlo problems
[DE86-007080] N86-31313
VASOCONSTRICTION
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213
VAX COMPUTERS
Cost Data Management System, CDMS version 2.2
[DE86-005064] N86-31446
VECTOR ANALYSIS
Near-field vector potentials for thin dipole antennas
[AD-A166542] N86-30902
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166762] N86-31243
Solving multi-state variable dynamic programming models using vector processing
[AD-A166763] N86-31244
Parallel solution of linear systems with striped sparse matrices. Part 1. VLSI networks for striped matrices
[AD-A166046] N86-31277
VEGETATION
Vegetation — X-SAR/SIR-C mission N86-31092
VELOCITY DISTRIBUTION
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
VELOCITY MEASUREMENT
Two component velocity measurements in fluctuating gas flows using a Laser Doppler Anemometer (LDA) N86-30965
Velocity precision measurements using laser Doppler anemometry N86-30966
First measurements with a laser Doppler anemometer in a high pressure natural gas pipe N86-30971
A new method for the determination of stationary mass flow rates of gases N86-30982
Chemically reacting turbulent flow
[PB86-196722] N86-31029
VENUS (PLANET)
On the differences in continental rifting at the Earth, Mars and Venus N86-31150
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
Studies of the aurorally-induced ultraviolet emissions on the nightside of Venus
[NASA-CR-177004] N86-31478
VENUS SURFACE
Rifting on Venus: Implications for lithospheric structure N86-31121
Rift systems on Venus: An assessment of mechanical and thermal models N86-31161
VERY HIGH FREQUENCY RADIO EQUIPMENT
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30906
VERY LARGE SCALE INTEGRATION
A high-speed asynchronous communication technique for MOS (Metal-Oxide-Semiconductor) VLSI systems
[AD-A166846] N86-30943
A coherent VLSI design environment
[AD-A166848] N86-30944
Development of dynamic very large scale integration memories
[BMFT-FB-T-85-176] N86-31234
VERY LOW FREQUENCIES
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] N86-30711
VESTIBULAR NYSTAGMUS
Analysis of nystagmus response to a pseudorandom velocity input N86-31426
VIABILITY
The Department of Defense statement on science in the science and technology program before the Subcommittee on Research and Development of the Committee on Armed Services of the United States House of Representatives, 99th Congress, second session
[AD-A166042] N86-31439
VIBRATION
Vibration and structureborne noise in space station
[NASA-CR-177148] N86-31336
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] N86-31339
VIBRATION DAMPING
Stiffness control of large space structures N86-30652
Aspects of active isolation as applied to a satellite structure with shape precision payload N86-30653
Structural dynamic aspects of rotor nodal isolation — helicopters N86-30665
Effects of model error on control of large flexible space antenna with comparisons of decoupled and linear quadratic regulator control procedures
[NASA-TP-2604] N86-30801
Sensitivity analysis and optimization of nodal point placement for vibration reduction
[NASA-TM-87763] N86-31069
Methods for the identification of material parameters in distributed models for flexible structures
[NASA-CR-178135] N86-31273
VIBRATION MODE
Static aeroelastic analysis using aircraft vibration modes N86-30641
Rapid vibration mode analysis of aircraft with external stores N86-30679
Influence of nonlinear spacecraft components on dynamic launch and in-orbit response N86-30688
VIBRATION TESTS
Advances in ground vibration testing using a combination of phase resonance and phase separation methods — aircraft testing N86-30669

Modal parameters estimation from driven-base tests — spacecraft structures N86-30672
Updating mathematical models on the basis of vibration and modal test results, a review of experience N86-30681
Low frequency design verification of large spacecraft structures N86-30686
Vibration qualification at the David Florida Laboratory — spacecraft N86-30687
Modified US Army U-8F ground vibration test
[NASA-TM-86741] N86-30723

VIBRATIONAL SPECTRA
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835

VIBRATORY LOADS
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070

VIRIAL THEOREM
Structure of the equation of state of real gases and liquids
[PTB-ME-69] N86-30832
Pressure and temperature measurements on natural gases along isochores in the technically important state ranging from 270 to 300 K and at pressures up to 60 bars N86-30970

VISCOELASTICITY
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130

VISCOSITY
Radiation data definitions and compilation for equipment qualification data bank
[NASA-CR-176259] N86-30818

VISCOUS FLOW
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] N86-30731
Implicit time dependent methods for inviscid and viscous compressible flows N86-30987
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings — conference
[VKI-LS-1986-02] N86-30988
Governing equations — viscous flow in turbomachinery bladings N86-30989
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics
[AD-A166960] N86-31009

VOICE COMMUNICATION
A Low-Data-Rate Voice Transmission System (LDRVTS) for HF communication
[AD-A166946] N86-30906
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] N86-30907

VOIDS
Void fraction measurement in two-phase flow with X-rays
[DE86-780422] N86-31025

VOLCANOES
Volcanic impact on stratospheric aerosol chemistry
[NASA-CR-176901] N86-31116
Late cretaceous extensional tectonics and associated igneous activity on the northern margin of the Gulf of Mexico Basin N86-31125
A regional 17-18 MA thermal event in Southwestern Arizona N86-31126
Potassium metasomatism of volcanic and sedimentary rocks in rift basins, calderas and detachment terranes N86-31128
Io: Mountains and crustal extension N86-31135
Heat and detachment in core-complex extension N86-31139
Hot-spot tectonics on Io N86-31142
Thermal control of the style of extensional tectonics N86-31148
Similarities and contrasts in tectonic and volcanic style and history along the Colorado plateaus-to-basin and range transition zone in Western Arizona: Geologic framework for tertiary extensional tectonics N86-31165

VOLCANOLOGY
Heat and detachment in core-complex extension N86-31139
Effects of lunar soil, Zagarni meteorite, and ocean ridge basalt on the excretion of iloic acid, a siderophore, and coproporphyrin by Bacillus subtilis N86-31421

VOLTAGE REGULATORS
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926

VOLUMETRIC ANALYSIS
The gas measuring bell: A basic normal equipment for the representation of volume unit for gases N86-30981

VORTEX FLAPS
PAN AIR application to the F-106B
[NASA-CR-178165] N86-30698

VORTEX SHEDDING
The 6th GAMM (Gesellschaft fuer Angewandte Mathematik und Mechanik) Conference on Numerical Methods in Fluid Mechanics
[AD-A166960] N86-31009

VORTICES
Influence of the form of the vortex bodies on the technical performance of a vortex meter N86-30978
Effects of previous disturbances on the meter factors of a vortex meter N86-30979
Vortex gas counter type WBZ 08. Practical experience N86-30980
Bursts and pressure fluctuations in turbulent boundary layers
[AD-A167186] N86-31012
CALTECH-DOE program on numerical analysis, scientific computing and fundamental studies of motion, energy and mass transfer in fluids
[DE86-008369] N86-31021

W

WAKES
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] N86-30730
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199

WARNING SYSTEMS
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
Severe local storm warning verification preliminary procedures
[PB86-194362] N86-31195

WARPAGE
Anisotropic wing aeroelastic theories with warping effects N86-30659

WATER
Potassium-water reactions in the vapor phase
[OEFZS-4327] N86-30833
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835
Evaluation of the corrosion of aluminum tubes under conditions of natural immersion in aqueous medium
[DE86-701579] N86-30859

WATER HEATING
Development of thermoelectric water heating-cooling devices
[AD-A166949] N86-31221

WATER RECLAMATION
NASA/American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program, 1985 — Space Stations and Their Environments
[NASA-CR-171931] N86-31409

WATER TREATMENT
Defining reclaimed water potability requirements N86-31422

WATER VAPOR
Void fraction measurement in two-phase flow with X-rays
[DE86-780422] N86-31025

WATER WAVES
The determination of modulation transfer functions from the 'Noordwijk' radar measurements in 1978 and 1979 — offshore platform
[BCRS-85-02] N86-30921
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199

WATERSHEDS
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

WAVE ATTENUATION
Surface acoustic wave dust-deposition sensor
[DE86-001068] N86-31345

WAVE DISPERSION
Problems in nonlinear acoustics: Parametric receiving arrays, focused finite amplitude sound and dispersive nonlinear interactions
[AD-A167311] N86-31343

WAVE EQUATIONS
A 3-D analysis of Maxwell's equations for cavities of arbitrary shape
[DE86-007883] N86-30919

WAVE FUNCTIONS
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] N86-30908

WAVE INTERACTION
Wave rotor research: A computer code for preliminary design of wave diagrams
[AD-A166760] N86-31005
Interactions between ocean surface waves and currents
[AD-A166688] N86-31199
Problems in nonlinear acoustics: Parametric receiving arrays, focused finite amplitude sound and dispersive nonlinear interactions
[AD-A167311] N86-31343

WAVE PROPAGATION
Betatron motion and optical deflection in free electron lasers
[DE86-009556] N86-31049
Cosmic ray sources, acceleration and propagation N86-31493
Coronal and interplanetary propagation, interplanetary acceleration, cosmic-ray observations by deep space network and anomalous component N86-31495
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507

WAVE REFLECTION
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914

WAVEFORMS
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901
Synthetic seismograms, graphic software and computer facilities
[AD-A166517] N86-31241

WAVEGUIDES
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30877
An investigation of dielectric loaded ridged waveguide
[AD-A167269] N86-30913

WEAK INTERACTIONS (FIELD THEORY)
Unified model for gravity-electro-weak interactions
[DE86-700688] N86-31474
Elementary particle physics N86-31487

WEAR
In situ examination of segregation and wear processes of precious metal electrical contact alloys
[DE86-009089] N86-30954
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050
Fuel component and heteroatom effects on deposits and wear
[AD-A166839] N86-31051

WEATHER FORECASTING
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] N86-30707
National Weather Service (NWS) Southern region QPF (Quantitative Precipitation Forecasting) Workshop
[PB86-196201] N86-30717
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166828] N86-31185
Severe local storm warning verification preliminary procedures
[PB86-194362] N86-31195

WEATHERING
Antarctic Meteorite Newsletter, volume 9, no. 2
[NASA-TM-88774] N86-31489

WEIGHT REDUCTION
Structural optimization programs and methods — aircraft weight reduction N86-30655
Recent results on the weight minimization of panels with a flutter speed constraint N86-30660
Design and development of the graphite epoxy structure for CS-3 satellite N86-30789

WEIGHTLESSNESS
Condensation heat transfer under a microgravity environment N86-31414
Selection of an appropriate animal model for study of bone loss in weightlessness N86-31436

WELDED JOINTS
Microstructure and properties of ferrous alloy weldments
[DE86-008368] N86-30850
Joining of ceramics for high temperature applications
[DE86-751572] N86-30878

Zirconia to cast iron brazing for uncooled diesel engines
[DE86-008982] N86-31058
Calorimetry of pulsed versus continuous gas tungsten arc welds
[DE86-009285] N86-31062
Acoustic emission transient recording
[DE86-006908] N86-31066
WELDED STRUCTURES
An investigation of stress-corrosion cracking susceptibility in candidate steels for tension leg platform tendons
[AD-A167286] N86-30844
WELDING
European Science Notes, volume 40, number 5
[AD-A166682] N86-31455
WESTLAND AIRCRAFT
The black box. Silence is silver, speech is golden
[ESA-86-97394] N86-30706
WETTING
Wetting and dispersion in ceramic/polymer melt injection molding systems
[DE86-009001] N86-30879
WHITE DWARF STARS
EX-111 thermal emission from hot white dwarfs: The suggested He abundance-temperature correlation. EX-112: The unique emission line white dwarf star GD 356
[NASA-CR-176866] N86-31470
WHITE NOISE
Phase comparison time delay estimation using wideband signals
[AD-A167025] N86-30910
WIENER HOPF EQUATIONS
The Hopf algebra of symmetric functions
[IR-250] N86-31325
WIND (METEOROLOGY)
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
Some atmospheric dispersion, wind and temperature statistics from Jervis Bay, Australian Capital Territory 1972 to 1974
[DE86-701370] N86-31192
Parameters determining maximum wind velocity in a tropical cyclone
[DE86-701371] N86-31193
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
WIND EFFECTS
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
WIND MEASUREMENT
Determination of the thermospheric neutral wind from incoherent scatter radar measurements
[KGI-186] N86-31178
WIND PROFILES
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31166
Typhoon structural variability
[AD-A166772] N86-31188
WIND TUNNEL APPARATUS
A numerical analysis for vertical gust field induced by gust generator N86-30637
WIND TUNNEL CALIBRATION
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] N86-30700
WIND TUNNEL TESTS
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings N86-30643
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model N86-30649
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] N86-31070
Laser techniques for arc jet plasma diagnostics; continuation of a feasibility and design study N86-31435
WIND TUNNELS
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] N86-31337
WIND TURBINES
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926
Wind energy in electric power production, preliminary study
[DE86-751566] N86-31109
WIND VELOCITY
Wind energy in electric power production, preliminary study
[DE86-751566] N86-31109
An atlas of objectively analyzed atmospheric cross sections, 1973-1980
[NASA-CR-176937] N86-31166
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31186
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189
Parameters determining maximum wind velocity in a tropical cyclone
[DE86-701371] N86-31193
Fire control method and analytical model for large liquid hydrocarbon pool fires N86-31419
WINDPOWER UTILIZATION
Application of an Additional Controllable Load (ACL) with chopper connected to the Direct Current Link (DCL) of an autonomous Wind Energy Power System (WEPS)
[EMV84-05] N86-30926
Development of an elastic-impulse power transmission for wind energy conversion systems
[DE86-900708] N86-31103
Wind energy in electric power production, preliminary study
[DE86-751566] N86-31109
Pacific Northwest Wind Regional Energy Assessment Program, volume 1
[DE86-007113] N86-31194
WINDPOWERED GENERATORS
Development of an elastic-impulse power transmission for wind energy conversion systems
[DE86-900708] N86-31103
WING LOADING
Application of transonic unsteady methods for calculation of flutter airloads N86-30630
WING OSCILLATIONS
Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings N86-30629
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow N86-30633
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity N86-30638
Anisotropic wing aeroelastic theories with warping effects N86-30659
WING PANELS
Recent results on the weight minimization of panels with a flutter speed constraint N86-30660
WING PLANFORMS
Transonic equivalent strip method for aeroelastic applications N86-30626
WING PROFILES
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow N86-30632
WINGLETS
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique N86-30678
WINGS
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings N86-30643
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique N86-30678
WIRE BRIDGE CIRCUITS
Electronic simulator and calibrator for electrothermal response test systems
[DE86-008874] N86-30898
WORKLOADS (PSYCHOPHYSIOLOGY)
Basic human factors considerations
[DE86-008181] N86-31223
WORKSTATIONS
Remote Science Operation Center research
[NASA-CR-176869] N86-30746
Semiconductor device modeling on a workstation
[DE86-001125] N86-31249
WYOMING
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143

X

X RAY ABSORPTION
X-ray absorption spectroscopy
[DE86-006728] N86-30824
Void fraction measurement in two-phase flow with X-rays
[DE86-780422] N86-31025
X RAY ANALYSIS
Simple, compact, high brightness source for X-ray lithography and X-ray radiography
[DE86-009723] N86-30956
X RAY ASTRONOMY
EX-111 thermal emission from hot white dwarfs: The suggested He abundance-temperature correlation. EX-112: The unique emission line white dwarf star GD 356
[NASA-CR-176866] N86-31470
X RAY BINARIES
Cosmic gamma-rays and cosmic nuclei above 1 TeV N86-31491
Ground-based very high energy gamma ray astronomy: Observational highlights N86-31502
Why is Cygnus X-3 (with related sources) a highlight of cosmic-ray astrophysics? N86-31503
Is the signal from Cyg X-3, as recorded in some underground experiments, real? N86-31506
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507
Observation of muons from Cygnus X-3 in the NUSEX experiment N86-31508
Search for a periodic signal from Cygnus X-3 usingmuons observed underground in the Frejus detector (4800 mwe) N86-31509
X RAY DIFFRACTION
Activities report in applied physics
[ESA-86-97387] N86-31459
X RAY INSPECTION
Nondestructive testing of fiber reinforced composites using X-ray fine structure procedures N86-30784
X RAY LASERS
Argon puff gas soft X-ray laser
[AD-A167127] N86-31041
X RAY SOURCES
Simple, compact, high brightness source for X-ray lithography and X-ray radiography
[DE86-009723] N86-30956
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
X RAY SPECTRA
Bimetallic fuel cell catalysts
[DE86-009259] N86-31108
X RAY SPECTROSCOPY
X-ray absorption spectroscopy
[DE86-006728] N86-30824
X RAY STARS
EX-111 thermal emission from hot white dwarfs: The suggested He abundance-temperature correlation. EX-112: The unique emission line white dwarf star GD 356
[NASA-CR-176866] N86-31470
X RAY STRESS ANALYSIS
Thermal residual stresses in symmetric and unsymmetric carbon fiber reinforced plastics: Some tentative ways of evaluation N86-30762
X RAY TELESCOPES
Manufacturing technology of grazing-incidence mirror carriers made of carbon fiber reinforced epoxy matrix systems --- spaceborne telescopes N86-30795
Development of high throughput X-ray telescopes for X-ray imaging and dispersive spectrometers
[NASA-CR-177074] N86-31358
X RAY TUBES
Coherent extreme ultraviolet generation and surface studies using ultraviolet excimer lasers
[AD-A167087] N86-31040

Y

YAG LASERS
Molecular mechanics of submicron thin monomeric and polymeric molecular films
[AD-A167277] N86-30870
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039

YTTRIUM OXIDES
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
YTTRIUM-ALUMINUM GARNET
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039

Z

ZINC
A method for predicting service life of zinc rich primers on carbon steel
[NASA-TM-83101] N86-30865
ZIRCALOYS (TRADEMARK)
Corrosion fatigue of Zircalloy-4 in chloride medium
[DE86-780339] N86-30845
Certification of carbon, nitrogen and oxygen in zircaloy. (BCR nos. 275 and 276)
[DE86-750679] N86-30848
ZIRCONIUM ALLOYS
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-008005] N86-30852
Mechanical property measurements on ion-irradiated metals
[DE86-009147] N86-30856
ZIRCONIUM OXIDES
Influence of Al2O3 on properties of yttria stabilized zirconia-Al2O3 composites
[AD-A167328] N86-30813
Zirconia to cast iron brazing for uncooled diesel engines
[DE86-008982] N86-31058

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

PERSONAL AUTHOR

BROOKS, D. E. N86-10136

NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

A

ABEL, J. N86-31342

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ABRAMOVICH (SHAUL), HAIFA (ISRAEL).
Gas dynamics of laser exhaust external to spacecraft
[AD-A167143] N86-31011

ACADEMY OF SCIENCES (USSR), LENINGRAD.
Observational properties of cosmic gamma-ray bursts
N86-31504

ACADEMY OF SCIENCES (USSR), MOSCOW.
Cosmic ray sources, acceleration and propagation
N86-31493
Is the signal from Cyg X-3, as recorded in some underground experiments, real?
N86-31506

ADELAIDE UNIV. (AUSTRALIA).
Extensive air showers (HE-4)
N86-31500

ADVANCED RESEARCH AND APPLICATIONS CORP., SUNNYVALE, CALIF.
Scanning photovoltage technique for high resolution non-destructive characterization of semiconductor wafers
[AD-A166864] N86-31382

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] N86-30708
Crashworthiness of airframes
[AGARD-R-737] N86-30709
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] N86-30726
Store separation flight testing
[AGARD-AG-300-VOL-5] N86-30727
Aircraft response to turbulence
[AGARD-R-738] N86-30739
Application of Ada higher order language to guidance and control
[AGARD-LS-146] N86-30740
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] N86-30741
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] N86-30931
Design of bolted joints in composites
[AGARD-R-727] N86-31064
The prospects for finite element analysis methods for structural qualification
[AGARD-R-736] N86-31083

AERODYNE RESEARCH, INC., BILLERICA, MASS.
A study of atmospheric reactions of neutral sodium species and other metals of meteoric origin
[AD-A166861] N86-31168

AEROJET ELECTROSYSTEMS CO., AZUSA, CALIF.
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] N86-30728

AERONAUTICAL RESEARCH ASSOCIATES OF PRINCETON, INC., N. J.
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] N86-30999

AERONAUTICAL SYSTEMS DIV., WRIGHT-PATTERSON AFB, OHIO.
Airborne navigation remote map reader evaluation
[AD-A166876] N86-30729
Ada (trade name) compiler validation summary report: Verdix Ada development system, version 5.2 for the sequent balance under DYNIX, release 1.3.2
[AD-A167231] N86-31232

AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] N86-30907

AIR COMMAND AND STAFF COLL., MAXWELL AFB, ALA.
A primer for program managers: Embedded software acquisition
[AD-A166731] N86-31441

AIR FORCE ARMAMENT LAB., EGLIN AFB, FLA.
An evaluation of a Parabolized Navier-Stokes (PNS) code for cone-cylinder-flared configurations
[AD-A166850] N86-31003

AIR FORCE BALLISTIC MISSILE DIV., NORTON AFB, CALIF.
Novel reentry vehicle instrument: The photodiode
[DE86-006234] N86-30808

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Meteorological measurements on line-of-sight microwave radio links: Environmental research papers, 1983 - 1985
[AD-A166627] N86-31184
A candidate mesoscale numerical cloud/precipitation model: Environmental research papers, Sep. 1984 - Sep. 1985
[AD-A166628] N86-31185

AIR FORCE HUMAN RESOURCES LAB., BROOKS AFB, TEX.
Summary of the technical objectives of Air Force efforts in the fields of training and personnel systems technology
[AD-A167348] N86-31456

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Control of large flexible systems by spatial modal input-distribution control
[AD-A166912] N86-30803
Intersatellite link design issues
[AD-A166761] N86-30904
Study of electrical resistivity on the location and identification of contamination
[AD-A166405] N86-30939
Analysis of a doubly coupled single fiber resonator
[AD-A166851] N86-31033
A study of ultraviolet emissions from the oxides of carbon in the mesosphere and shuttle environment
[AD-A166376] N86-31167
The effect of smoothing the Doppler radar derived wind field on perturbation pressure retrieval
[AD-A166631] N86-31196
Meteorological teleconnections between the Sahel and the eastern United States
[AD-A166632] N86-31187
Typhoon structural variability
[AD-A166772] N86-31188
A quantitative characterization of control flow context: Software measures for programming environments
[AD-A166752] N86-31243
Solving multi-state variable dynamic programming models using vector processing
[AD-A166783] N86-31244
Application of YBJ (Youla, Bongiorno and Jabr) control theory to the initial response problem
[AD-A166756] N86-31267

AIR FORCE OCCUPATIONAL AND ENVIRONMENTAL HEALTH LAB., BROOKS AFB, TEX.
Assessing possible damage due to radio frequency radiation
[AD-A166913] N86-31214

AIR FORCE OFFICE OF SCIENTIFIC RESEARCH, BOLLING AFB, WASHINGTON, D.C.
AFOSR (Air Force Office of Scientific Research) technical report summaries
[AD-A166142] N86-31453

AIR FORCE ROCKET PROPULSION LAB., EDWARDS AFB, CALIF.
Descriptive characterization of solid ingredients
[AD-A166874] N86-30885

AIR FORCE SYSTEMS COMMAND, WRIGHT-PATTERSON AFB, OHIO.
International Aviation (selected articles)
[AD-A166748] N86-30690
Liquid hydrogen fueled passenger aircraft
[AD-A166229] N86-30724
Chinese Journal of Lasers, the tenth year (1974-1984)(selected articles)
[AD-A166747] N86-31039
A new material with great prospect: Rapidly solidified microcrystal material
[AD-A166304] N86-31380
Investigation on growth and laser properties of GGG:(Nd,Cr) single crystals
[AD-A166392] N86-31381

AIR FORCE WEAPONS LAB., KIRTLAND AFB, N. MEX.
Raman scattering analysis of thin-film coatings using guided waves
[DE86-008776] N86-30677

AIR FORCE WRIGHT AERONAUTICAL LABS., WRIGHT-PATTERSON AFB, OHIO.
A review of aeroelastic research at the Flight Dynamics Laboratory
N86-30642
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] N86-30725
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] N86-30821
Fiscal year 1987 technical objective document
[AD-A166659] N86-31454

AIRESEARCH MFG. CO., LOS ANGELES, CALIF.
Space station molecular sieve development
[NASA-CR-178885] N86-30864

ALABAMA UNIV., BIRMINGHAM.
Mossbauer spectroscopy of extraterrestrial materials
N86-31410

ALASKA UNIV., FAIRBANKS.
Black holes, waves, and energized particles from high altitude explosive plasma perturbation experiments
N86-31464

ALLIED BENDIX CORP., KANSAS CITY, MO.
Stress relaxation of cellular silicone material: 1984
[DE86-009131] N86-30880
Robot-assisted torque measurement
[DE86-009129] N86-31061
Improved magnetic particle inspection of small threaded fasteners
[DE86-009324] N86-31067
CAD-CAM Data Exchange Pilot Project
[DE86-009128] N86-31257

ALPHATECH, INC., BURLINGTON, MASS.
Studies in mathematical models of human decisionmaking in gaming situations
[AD-A166696] N86-31317
HQ AFSC/TE (Headquarters, Air Force Systems Command Deputate for Test and Evaluation) resource manager's handbook
[AD-A166705] N86-31440

AMAX EXPLORATION, INC., TUCSON, ARIZ.
Thermal regimes in the detachment fault environment as deduced from fluid inclusions N86-31122

AMSTERDAM UNIV. (NETHERLANDS).
Evaluation of research: Experiences and perspectives in the Netherlands
[ESA-86-96709] N86-31461

SOURCE

ARGONNE NATIONAL LAB., ILL.
Oxidation/corrosion behavior of low-chromium Fe-Cr-Ni alloys containing zirconium of niobium
[DE86-008005] N86-30652
Two-surface plastic model for concrete and geomaterials
[DE86-007475] N86-31080
Distributed geographic mapping using a centralized DISSPLA-based mapping system and AUTOCAD PC software
[DE86-009184] N86-31096
DeWitt field study: Surface flux observations, in situ soundings and remote sensing of conditions affecting the behavior of the mixed layer over land
[DE86-008942] N86-31177
Fully parallel algorithm for the symmetric eigenvalue problem
[DE86-007553] N86-31254
User guide for JAKEF, revision 1
[DE86-007554] N86-31255
Automated reasoning: Basic research problems
[DE86-009214] N86-31270
Evidence from the Soudan 1 experiment for underground muons associated with Cygnus X-3 N86-31507

ARIZONA BUREAU OF GEOLOGY AND MINERAL TECHNOLOGY, TUCSON.
Cenozoic extension and magmatism in Arizona N86-31158
Possible role of crustal flexure in the initial detachment of extensional allochthons N86-31162

ARIZONA STATE UNIV., TEMPE.
Transonic equivalent strip method for aeroelastic applications N86-30628
Hot-spot tectonics on Io N86-31142
Extensional tectonics of the Saturnian Satellites N86-31146

ARIZONA UNIV., TUCSON.
Tectonic determinations of lithospheric thickness on Ganymede and Callisto N86-31130
Metamorphic core complexes: Expression of crustal extension by ductile-brittle shearing of the geologic column N86-31131
The Heart Mountain fault: Implications for the dynamics of decollement N86-31143
Time-of-flight spectroscopy of ionic and metastable fragments from dissociating molecules
[AD-A166063] N86-31346
Modulation and anisotropy of galactic cosmic rays in the heliosphere N86-31496

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.
Effects of surface microroughness in ellipsometry
[DE86-008014] N86-31364

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.
A design method for autofrettaged thick-walled cylinders with outside diameter discontinuities
[AD-A166681] N86-31076

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, WHITE SANDS MISSILE RANGE, N. MEX.
The US Army Yuma Proving Ground, Arizona 22-year climate calendar 1954-1975
[AD-A166878] N86-31189

ARMY ENGINEER DISTRICT, LOS ANGELES, CALIF.
Coast of California storm and tidal waves study: Southern California coastal processes data summary
[AD-A166699] N86-31200
Coast of California storm and tidal waves study. Shoreline movement data report: Portuguese Point to Mexican border (1852-1982)
[AD-A166749] N86-31201
Coast of California storm and tidal waves study: Southern California coastal photography and beach profile index
[AD-A166780] N86-31202
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166781] N86-31203
Coast of California storm and tidal waves study. Hydraulic data inventory: Southern California coastal zone
[AD-A166782] N86-31204

ARMY ENGINEER TOPOGRAPHIC LABS., FORT BELVOIR, VA.
Geographic information systems in robotic vehicles
[AD-A166859] N86-31053
Astrogeodetic deflections of the vertical from stars observations with the Danjon Astrolabe, or similar instruments
[AD-A166886] N86-31488

ARMY MILITARY PERSONNEL CENTER, ALEXANDRIA, VA.
A GaAs based digital serial communications system
[AD-A166080] N86-30900

ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
The technical cooperation program subgroup K panel presentations
[AD-A166407] N86-30901

ARMY RESEARCH INST. OF ENVIRONMENTAL MEDICINE, NATICK, MASS.
Metabolic changes following eccentric exercise in trained and untrained men
[AD-A166521] N86-31211
Induced erythrocythemia and maximal aerobic power: An examination of modifying factors
[AD-A166522] N86-31212
Intrinsic alteration of the reactive properties of arteries during hypothermia
[AD-A166523] N86-31213

ARNOLD ENGINEERING DEVELOPMENT CENTER, ARNOLD AIR FORCE STATION, TENN.
Pressure test of three elliptic missile body configurations
[AD-A166552] N86-30699
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166688] N86-30700
Aircraft transparency testing: Artificial birds
[AD-A166632] N86-30704

ASSOCIACAO BRASILEIRA DE CIENCIAS MECANICAS, RIO DE JANEIRO.
Proceedings of the 3rd Brazilian Symposium on Piping and Pressure Vessels
[DE86-700752] N86-31014

ATOMIC ENERGY RESEARCH ESTABLISHMENT, HARWELL (ENGLAND).
Dynamic mechanical analysis as an aid to the characterization of composite materials N86-30763

AUBURN UNIV., ALA.
Solid-propellant rocket motor internal ballistics performance variation analysis, phase 5
[NASA-CR-177145] N86-30809
Semiconductor alloy theory
[AD-A167306] N86-31387

AUSTRALIAN ATOMIC ENERGY COMMISSION, LUCAS HEIGHTS.
Some atmospheric dispersion, wind and temperature statistics from Jervis Bay, Australian Capital Territory 1972 to 1974
[DE86-701370] N86-31192

AUSTRALIAN NATIONAL UNIV., CANBERRA.
Network approach to large-scale experimental data acquisition and analysis
[DE86-701200] N86-31264

AVCO-EVERETT RESEARCH LAB., MASS.
Diffuse discharge switch analysis
[AD-A167282] N86-30945

B

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Review on compression ignition sensitivity studies of liquid gun propellants
[AD-A165969] N86-30884
A two-dimensional study of the influence on target loading of numerical wave reflections from transmissive computational boundaries
[AD-A167299] N86-30914

BATTELLE COLUMBUS LABS., OHIO.
Effect of manufacturing processes on structural allowables, phase 1
[AD-A166857] N86-30842
Gas-engine heat pump test procedures
[PB86-201662] N86-31063

BEGELEIDINGSCOMMISSIE REMOTE SENSING, DELFT (NETHERLANDS).
The determination of modulation transfer functions from the 'Noordwijk' radar measurements in 1978 and 1979
[BCRS-85-02] N86-30921

BERN UNIV. (SWITZERLAND).
Forbush decreases geomagnetic and atmospheric effects cosmogenic nuclides N86-31497

BREMEN UNIV., (WEST GERMANY).
Oceanography N86-31090

BRITISH AEROSPACE DYNAMICS GROUP, BRISTOL (ENGLAND).
Design and development testing of the bonded joint between a typical launch vehicle attachment ring and CFRP thrust cone N86-30790

BRITISH AEROSPACE DYNAMICS GROUP, HATFIELD (ENGLAND).
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 N86-30644

BRITISH AEROSPACE DYNAMICS GROUP, STEVENAGE (ENGLAND).
The development of the Ariane 4 SPELDA N86-30786

BRITISH LIBRARY LENDING DIV., BOSTON SPA (ENGLAND).
Study of settling of metallized sinter in reducing atmosphere
[BLL-M-36597-(5828.4)] N86-30836
Experimental and analytical results of large-scale pressurized thermal shock testing
[BLL-RISLEY-TR-5282-(9091.9F)] N86-31068
Atomistic study of stacking faults in ordered Ni sub 3 Fe phase
[BLL-M-36717-(5828.4)] N86-31376

BROOKHAVEN NATIONAL LAB., UPTON, N. Y.
Fuel cell reactions in super acid electrolytes
[PB86-201084] N86-31114
Acid deposition: A national problem
[DE86-007810] N86-31117
Chemical instrumentation for field studies of atmospheric wet deposition processes
[DE86-005255] N86-31175

BROWN UNIV., PROVIDENCE, R. I.
Stochastic systems with small noise, analysis and simulation: A phase locked loop example
[AD-A166148] N86-30937
Use of the shadow spot method in evaluating J for ductile steels
[AD-A166834] N86-31074
The stress intensity factor history due to three dimensional transient loading of the faces of a crack
[AD-A166835] N86-31075
Low-angle normal faults-low differential stress at mid crustal levels N86-31154
Filtering and control for wide bandwidth noise driven systems
[AD-A166964] N86-31268

BRUSSELS UNIV. (BELGIUM).
New prediction methods for composites hygrothermal behavior N86-30771

BUNDESANSTALT FUER GEOWISSENSCHAFTEN UND ROHSTOFFE, HANNOVER (WEST GERMANY).
Hydrology N86-31089

BUNDESANSTALT FUER MATERIALPRUEFUNG, BERLIN (WEST GERMANY).
Tribology documentation: Wear, friction, and lubrication
[BAM-GFT-19-1983/84] N86-31050

C

CALIFORNIA INST. OF TECH., PASADENA.
CALTECH-DOE program on numerical analysis, scientific computing and fundamental studies of motion, energy and mass transfer in fluids
[DE86-008369] N86-31021
Interaction of seismic waves with complex structures
[AD-A166715] N86-31170

CALIFORNIA POLYTECHNIC STATE UNIV., SAN LUIS OBISPO.
Aerodynamic drag reduction tests on a box-shaped vehicle
[NASA-CR-176982] N86-30692
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] N86-30722
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] N86-30736
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] N86-30738
Application of a low order panel method to complex three-dimensional internal flow problems
[NASA-CR-179656] N86-31001

CALIFORNIA UNIV., BERKELEY.
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity N86-30638
Delamination fracture toughness of composite spacecraft structures N86-30777
A linear array for Rayleigh scattering
[AD-A167109] N86-30822
An augmented alagrangian formulation for the finite element solution of contact problems
[AD-A166649] N86-31073
Particle acceleration by the sun N86-31494

CALIFORNIA UNIV., BERKELEY. LAWRENCE BERKELEY LAB.
Theory of strengthening by ordered precipitates
[DE86-009355] N86-30861
Relativistic klystron
[DE86-009217] N86-30951

Bimetallic fuel cell catalysts
[DE86-009259] N86-31108
Basic considerations on surface optical nonlinearities
[DE86-008378] N86-31365
Multilayer reflectors for the extreme ultraviolet spectral region
[DE86-008374] N86-31368
Schottky and ohmic Au contacts on GaAs, microscopic and electrical investigation
[DE86-007610] N86-31396

CALIFORNIA UNIV., LOS ANGELES.
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] N86-30718
A numerical study of forced lithospheric thinning N86-31159
Evaluation of the total magnetospheric energy output parameter, U/sub T/
[DE86-006017] N86-31173
Neurophysiological research supporting the investigation of adaptive network architectures
[AD-A166074] N86-31216
Superposed epoch analysis of magnetospheric substorms using solar wind, auroral zone and geostationary orbit data sets
[DE86-006036] N86-31481

CALIFORNIA UNIV., SAN DIEGO.
Active plasma release experiments
[NASA-CR-176897] N86-31462
A magnetospheric critical velocity experiment: Particle results N86-31463
Extragalactic astronomy N86-31489

CALIFORNIA UNIV., SAN DIEGO, LA JOLLA.
Gradients and anisotropies of high energy cosmic rays in the outer heliosphere
[NASA-CR-176944] N86-31522

CALIFORNIA UNIV., SANTA BARBARA.
Duty cycle testing and performance evaluation of the SM-229 teleoperator
[DE86-004780] N86-31059

CALSPAN FIELD SERVICES, INC., ARNOLD AFS, TENN.
Aircraft transparency testing: Artificial birds
[AD-A166832] N86-30704

CAMBRIDGE UNIV. (ENGLAND).
Application of full Navier-Stokes solvers to turbomachinery flow problems N86-30998

CARNEGIE-MELLON UNIV., PITTSBURGH, PA.
Measurements in liquid fuel sprays
[NASA-CR-177088] N86-30960
The numerical solution of the Navier-Stokes equations for incompressible flows and the applicability of the stream function formulation of the Navier-Stokes equations
[AD-A166061] N86-31002

CENTRAL INST. OF PHYSICS, BUCHAREST (RUMANIA).
Piecewise analytical perturbation series methods for solving linear ordinary different equation. Part 1: General schemes for algorithm implementation

The best bound in the L log L inequality of Hardy and Littlewood and its martingale counterpart
[IR-266] N86-31305
Transfinite classification of weakly-infinite dimensional spaces
[IR-276] N86-31306
Some continuity theorems in probability
[IR-257] N86-31315
The Hasse-Witt matrix of a formal group
[IR-238] N86-31323
A method for constructing ordered continua
[IR-240] N86-31324
The Hopf algebra of symmetric functions
[IR-250] N86-31325
A separable normal topological group which is not Lindelöef
[IR-252] N86-31326
Convex Hilbert cubes in superextensions
[IR-254] N86-31327
Function spaces of low Borel complexity
[IR-260] N86-31328
Invariant arcs, Whitney levels, and Kelley continua
[IR-268] N86-31329
A Dowkes group
[IR-269] N86-31330
The Azema-Yor stopping time and ultimateness
[IR-273] N86-31331
On the product of homogeneous spaces
[IR-274] N86-31332

W

WALDRICH SIEGEN WERKZEUGMASCHINEN G.M.B.H., BURBACH (WEST GERMANY).
Theoretical and experimental behavior of carbon fiber reinforced plastics under mechanical and thermal load N86-30767
WASHINGTON STATE UNIV., PULLMAN.
Condensation heat transfer under a microgravity environment N86-31414
WASHINGTON UNIV., SEATTLE.
A study of the discrepant QSO X-ray luminosity function from the HEAO-2 data archive
[NASA-CR-176875] N86-31467
WASHINGTON UNIV., ST. LOUIS, MO.
Development and application of the P-version of the finite element method
[AD-A166056] N86-31279
WEAPONS SYSTEMS RESEARCH LAB., ADELAIDE (AUSTRALIA).
Evaluation of igniter compositions SR371C and SR44
[AD-A167007] N86-30810
WEATHER CORP., WESTON, MASS.
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] N86-30705
WISCONSIN BOARD OF VOCATIONAL, TECHNICAL AND ADULT EDUCATION, MADISON.
Wisconsin Electric and Hybrid Vehicle Demonstration Project
[DE86-009318] N86-31457
WISCONSIN UNIV., MADISON.
Thermal and electrical contact conductance studies
[NASA-CR-177093] N86-31378
Crystallization of sputter deposited amorphous metal thin films
[DE86-008958] N86-31401
Muons and neutrinos N86-31501
WISCONSIN UNIV., MILWAUKEE.
Sieves for Gaussian processes
[AD-A166055] N86-31319
WYOMING UNIV., LARAMIE.
Thermomechanical modeling of the Colorado Plateau-Basin and range transition zone N86-31138

Y

YALE UNIV., NEW HAVEN, CONN.
In situ monitoring of electrochemical reactions by surface enhanced Raman scattering
[PB86-201076] N86-30835
YOKOHAMA NATIONAL UNIV. (JAPAN).
Emulsion chamber observations and interpretation (HE 3) N86-31499

Typical Contract Number Index Listing

DE-AC06-77RL-01030 ..... N86-10633

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues are available for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 24, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by RMS Associates.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 22, 1988.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

SUBJECT SCOPE

Subject scope of *STAR*, and *IAA* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

HOW TO USE *STAR* SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Adminstration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its' Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free. (See discussion of NASA patents and patent applications below.)

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02. Microfiche are sold at price code A01. The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at $1.50 per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;
2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
ATTN: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF *STAR* ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue and other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $70.00 North America; $140.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA - Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

VOLUME 24 NUMBER 23 / DECEMBER 8, 1986

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 3549

02 AERODYNAMICS 3549
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.
For related information see also *34 Fluid Mechanics and Heat Transfer*

03 AIR TRANSPORTATION AND SAFETY 3552
Includes passenger and cargo air transport operations; and aircraft accidents.
For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation.*

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 3553
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.
For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications.*

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 3554
Includes aircraft simulation technology.
For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics.*

06 AIRCRAFT INSTRUMENTATION 3557
Includes cockpit and cabin display devices; and flight instruments.
For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography.*

07 AIRCRAFT PROPULSION AND POWER 3557
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.
For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion.*

08 AIRCRAFT STABILITY AND CONTROL 3559
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 3560
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.
For related information see also *14 Ground Support Systems and Facilities (Space).*

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*

12 ASTRONAUTICS (GENERAL) 3561
For extraterrestrial exploration see *91 Lunar and Planetary Exploration.*

13 ASTRODYNAMICS 3562
Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 3563
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.
For related information see also *09 Research and Support Facilities (Air).*

15 LAUNCH VEHICLES AND SPACE VEHICLES 3564
Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 3564
Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.
For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation.*

17 SPACECRAFT COMMUNICATION, COMMAND AND TRACKING 3564
Includes telemetry; space communications networks; astronavigation; and radio blackout.
For related information see also *04 Aircraft Communications and Navigation* and *32 Communications.*

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 3565
Includes spacecraft thermal and environmental control; and attitude control.
For life support systems see *54 Man/System Technology and Life Support.* For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics.*

19 SPACECRAFT INSTRUMENTATION 3567
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography.*

20 SPACECRAFT PROPULSION AND POWER 3567
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion.*

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) **3570**
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS **3570**
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY **3573**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics.*

26 METALLIC MATERIALS **3576**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **3581**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS **3584**
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion.*

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics.*

31 ENGINEERING (GENERAL) **3585**
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS **3586**
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking.*

33 ELECTRONICS AND ELECTRICAL ENGINEERING **3590**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuity.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics.*

34 FLUID MECHANICS AND HEAT TRANSFER **3595**
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics.*

35 INSTRUMENTATION AND PHOTOGRAPHY **3600**
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources.* For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation.*

36 LASERS AND MASERS **3604**
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING **3605**
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY **3609**
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS **3609**
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance.*

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) **N.A.**

43 EARTH RESOURCES **3613**
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION **3619**
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation.*

45 ENVIRONMENT POLLUTION **3622**
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS **3623**
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY **3626**
Includes weather forecasting and modification.

48 OCEANOGRAPHY **3633**
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) **3634**
Includes genetics.

52 AEROSPACE MEDICINE **3635**
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES **3636**
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT **3637**
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY **3638**
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) **3639**

60 COMPUTER OPERATIONS AND HARDWARE **3639**
Includes computer graphics and data processing.
For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE **3640**
Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS **3646**
Includes computer networks.

63 CYBERNETICS **3647**
Includes feedback and control theory.
For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS **3649**
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY **3653**
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS **3655**
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS **3655**
Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also *Engineering*.

70 PHYSICS (GENERAL) **3656**
For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS **3657**
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS **3657**
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS **3659**
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS **3660**
Includes light phenomena.

75 PLASMA PHYSICS **3662**
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS **3664**
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS **3667**
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) **N.A.**
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT **3668**
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE **3670**
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS **N.A.**
Includes cost effectiveness studies

84 LAW AND POLITICAL SCIENCE **3671**
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION **3671**
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety, 16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) **3671**

89 ASTRONOMY **3676**
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS **3677**
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION **3679**
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS **N.A.**
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION **N.A.**
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

COSATI CODE

A recently developed multiple scale turbulence model is used for the numerical prediction of isothermal, confined turbulent swirling flows. Because of the streamline curvature and nonequilibrium spectral energy transfer nature of the swirling flow, the utilized multiple scale turbulence model includes a different set of response equations for each of the large scale energetic eddies and the small scale transfer eddies. Predictions are made of a confined coaxial swirling jet in a sudden expansion and comparisons are made with experimental data and with the conventional single scale two equation model. The multiple scale model shows significant improvement of predictions of swirling flows over the single scale k epsilon model. The sensitivity study of the effect of prescribed inlet turbulence levels on the flow fields is also included. Author

ELLIPTIC GENERATION OF COMPOSITE THREE-DIMENSIONAL GRIDS ABOUT REALISTIC AIRCRAFT
Reese L. Sorenson Mar. 1986 22 p
(NASA-TM-88240; A-86165; NAS 1.15:88240) Avail: NTIS HC A02/MF A01 CSCL 01B

An elliptic method for generating composite grids about realistic aircraft is presented. A body-conforming grid is first generated about the entire aircraft by the solution of Poisson's differential equation. This grid has relatively coarse spacing, and it covers the entire physical domain. At boundary surfaces, cell size is controlled and cell skewness is nearly eliminated by inhomogeneous terms, which are found automatically by the program. Certain regions of the grid in which high gradients are expected, and which map into rectangular solids in the computational domain, are then designated for zonal refinement. Spacing in the zonal grids is reduced by adding points with a simple, algebraic scheme. Details of the grid generation method are presented along with results of the present application, a wing-body configuration based on the F-16 fighter aircraft. Author

AN ANALYTICAL METHODOLOGY FOR PREDICTING REPAIR TIME DISTRIBUTIONS OF ADVANCED TECHNOLOGY AIRCRAFT M.S. Thesis
Dennis C. Dietz Dec. 1985 226 p
(AD-A167149; AFIT/GOR/OS/85D-3) Avail: NTIS HC A11/MF A01 CSCL 15/5

Classical probability theory is applied to analytically combine known or hypothesized subsystem reliability distribution for repair time of an advanced technology aircraft. While repair time of a weapon system is determined by a complex interaction of many factors, the relatively high reliability predicted for advanced technology aircraft justifies several simplifying assumptions which permit an analytical approach. The applicability of the analytical method is examined by comparing analytical repair time distributions with distributions produced by Monte Carlo simulation. Using the Advanced Tactical Fighter as an example, comparisons are performed over a wide range of relevant factors. Overall aircraft reliability emerges as the single critical factor determining the applicability of the method. A simple model is presented for translating the aircraft repair time distribution into measures of aircraft operational effectiveness (availability and sortie generation rate) under a specified concept of operations. The translation model demonstrates how the analytical method for forming a repair time distribution could be used to heuristically determine how to best allocate a reliability and maintainability budget to various subsystems as an aircraft design is developed. IBUNGSFREIEN MEHRWIRBEL- MODELLS ZUR BERECHNUNG DER WIRBELSTROEMUNG HINTER EINEM TRAGFLUEGEL MIT SPOILER]
W. Czichowsky 15 Oct. 1984 71 p In GERMAN
(ISL-R-133/84; ESA-86-97621) Avail: NTIS HC A04/MF A01

The flow about an airfoil profile with spoiler was calculated using an inviscid multivortex model. This flow leads at the airfoil trailing edge and the spoiler edge to boundary layer separation and wakes with vortices. The model replaces the separated vortex boundary layers by a series of discrete potential vortices. By a conformal transformation of the outside of a circle onto the outside of a profile, the flow about a profile is reduced to the simple case of a flow about a circular cylinder with potential vortices, the complex flow potential of which is known. The intensity of the new vortices are obtained from the production of circulation in the boundary layers. The coordinates of the vortex centers are empirically fixed in the immediate vicinity of the separation edges. The vortex motions are calculated by numerical integration of the vortex differential equations. The forces on the profile are directly obtained from the generalized Blasius formula for unsteady flows. For the supercritical profile RA16-SC1 with a 40 deg arc spoiler, the formation and separation of vortices, the evolution of the circulation production rate in the boundary layers, and aerodynamic coefficients are obtained. ESA

N86-31546# European Space Agency, Paris (France).
CALCULATION OF SEPARATED LAMINAR SUPERSONIC FLOWS OVER BLUNT BODIES OF REVOLUTION AT ZERO ANGLE OF ATTACK
Bernhard Mueller Dec. 1985 144 p Original language document was announced as N86-14256
(ESA-TT-953; DFVLR-FB-85-30; ESA-86-97801) Avail: NTIS HC A07/MF A01; original German version available from DFVLR, Cologne, West Germany DM 40.50

The applicability of the thin layer approximation method for the description of thin separation bubbles and large separation areas and data acquisition on the structure of separated three dimensional flow distribution is studied using the numerical simulation of separated laminar supersonic flows over blunt bodies of revolution. The influence of numerical damping on the consistency, stability, convergence and accuracy of the finite difference scheme of Beam and Warming is studied. The topologic structure of the separation area depends on the Reynolds number. The thin layer approximation allows an accurate description of flows with small or large separation areas at high Reynolds numbers. ESA

WALL SHEAR STRESS MEASUREMENTS ON A PROLATE SPHEROID AT ZERO INCIDENCE IN THE GERMAN-NETHERLANDS WIND (DNW) TUNNEL
Hans-Peter Kreplin, Hans Ulrich Meier, Edzard Mercker, and Andreas Landhaeusser Feb. 1986 41 p
(DFVLR-Mitt-86-06; ISSN-0176-7739; ESA-86-97822) Avail: NTIS HC A03/MF A01; DFVLR, Cologne, West Germany DM 11.50

Surface hot film measurements were carried out on a prolate spheroid in the three closed test sections of a wind tunnel. For axisymmetric flow conditions the regions of laminar-turbulent boundary layer transition were determined from measured wall shear stress distributions and instantaneous hot film signals. The results clearly indicate that the location of the boundary layer transition moves downstream at a given tunnel Reynolds number as the turbulence intensity decreases with increasing nozzle contraction. ESA

NASA'S AIRCRAFT ICING ANALYSIS PROGRAM
Robert J. Shaw 1986 26 p Presented at the International Conference of the Aeronautical Sciences (ICAS), London, England, 7-12 Sept. 1986
(NASA-TM-88791; E-3121; NAS 1.15:88791) Avail: NTIS HC A03/MF A01 CSCL 01C

An overview of the NASA ongoing efforts to develop an aircraft icing analysis capability is presented. Discussions are included of the overall and long term objectives of the program as well as current capabilities and limitations of the various computer codes being developed. Descriptions are given of codes being developed to analyze two and three dimensional trajectories of water droplets, airfoil ice accretion, aerodynamic performance degradation of components and complete aircraft configurations, electrothermal deicer, fluid freezing point depressant antideicer and electro-impulse deicer. The need for bench mark and verification data to support the code development is also discussed, and selected results of experimental programs are presented. Author

FIREPROOF HYDRAULIC BRAKE SYSTEM Final Report, May - Nov. 1985
Michael W. Dillard Apr. 1986 66 p
(AD-A167774; Rept-4950/FTR-86-1) Avail: NTIS HC A04/MF A01 CSCL 13/7

The Fireproof Hydraulic Brake System (FHBS) flight test program verified that the FHBS is a feasible method of eliminating aircraft hydraulic fluid fires ignited by hot brakes. The FHBS uses a new nonflammable hydraulic fluid, chlorotrifluoroethylene (CTFE), in the wheel well and landing gear area while retaining standard hydraulic fluid (MIL-H-5606) in the rest of the aircraft hydraulic system. The two fluids were separated downstream of the antiskid valve by a reservoir/separator unit. A C-135E was used as the test aircraft. The modification consisted of instrumentation to monitor brake system parameters and the FHBS installation for the left outboard wheel pair. The testing consisted of maximum effort braking runs at light aircraft gross weights to induce antiskid cycling. The FHBS was evaluated subjectively by the test pilot and objectively by comparing its performance with that of the standard C-135 brake system established by baseline testing. GRA

FULL-SCALE CRASH TEST (T-41) OF THE YAH-63 ATTACK HELICOPTER
Kent F. Smith Apr. 1986 99 p
(AD-A167813; USAAVSCOM-TR-86-D-2) Avail: NTIS HC A05/MF A01 CSCL 01/3

T-41 was jointly conducted by the Aviation Applied Technology Directorate and the NASA-Langley Research Center. The purpose of the effort was to assess the effectiveness of the structural crashworthiness features designed into the YAH-63 during a severe but potentially survivable accident and to evaluate the performance of several developmental crashworthy systems in a real-world helicopter crash environment. Because this was the first crash test of an attack helicopter and the first of a helicopter having designed-in crashworthiness, T-41 offers unique data for predicting the crash impact behavior of future helicopters. SIMULATION EVALUATION OF DISPLAY/FLIR CONCEPTS FOR LOW-ALTITUDE, TERRAIN-FOLLOWING HELICOPTER OPERATIONS
Harry N. Swenson, Clyde H. Paulk, Jr., Robert L. Kilmer (IBM Federal Systems Div., Owego, N. Y.), and Frank G. Kilmer Dec. 1985 13 p
(NASA-TM-86779; Rept-85349; NAS 1.15:86779) Avail: NTIS HC A02/MF A01 CSCL 17G

A piloted simulation of three head-down display (HDD) concepts with flight-director guidance superimposed on forward-looking infrared (FLIR) imagery was performed to evaluate the task of low-level, terrain-following (TF), manual helicopter flight. The three display concepts were examined for the purpose of finding ways by which aircraft flight-attitude and command symbols and FLIR imagery could be integrated onto one instrument. In all cases, the FLIR imagery was centered on the flight-path vector of the aircraft. The three displays were then characterized by having: (1) pitch attitude conformal to the FLIR imagery; (2) pitch attitude conformal to the FLIR imagery, but with an increase in the scaling; and (3) pitch attitude nonconformal to the FLIR imagery with the same pitch scaling as in (2). The simulation was conducted on the Vertical Motion Simulator (VMS) at Ames Research Center, using NASA and Air Force test pilots. The pilots indicated that the nonconformal pitch attitude and FLIR display was the preferred way to display information because of the absence of pitch-attitude information on displays (1) and (2) during some portions of the operational flight envelope. PORTABLE GLIDE SLOPE INDICATOR Patent Application
Harry L. Task, inventor (to Air Force) Filed 26 Jan. 1986 15 p
(AD-D012240; US-Patent-Appl-SN-823872) Avail: NTIS HC A02/MF A01 CSCL 17/7

An improved glide slope indicator system for facilitating aircraft landings under adverse lighting conditions on remote or austere landing sites is provided which comprises a pair of indicators deployable near ground level on each side of a runway, each indicator including a housing having an optical window and a pair of light sources mounted in predetermined spaced relationship to each other and to the optical window and connected to a power source and related circuitry to project a well defined first blinking and second steady light beam of predetermined angular divergence and overlap, one indicator disposed to project beams with an overlap elevated at a first angle relative to horizontal and the other indicator disposed to project beams with an overlap elevated at a second angle relative to horizontal different from the first, with a preselected glide path lying between the two overlaps. An infrared filter may be included in each indicator to project beams observable only with infrared sensitive viewing aids. The system may be battery powered for portability. GRA

A COST/PERFORMANCE ANALYSIS OF HYBRID INERTIAL/EXTERNALLY REFERENCED POSITIONING/ORIENTATION SYSTEMS
Eugene J. Rose, Sam C. Bose, James T. Kouba, and David A. Sobek Sep. 1985 23 p
(AD-A167685; ETL-R-086) Avail: NTIS HC A02/MF A01 CSCL 17/7

Combining inertial positioning or navigation systems with externally referenced aids such as the Global Positioning System (GPS) or the U.S. Army's Position Location Reporting System (PLRS) will result in significant improvements over one of these systems acting on its own. These improvements will include lower cost, since less accurate inertial systems can be used during periods when the external reference is unavailable; better immunity to jamming than in the case of only an externally referenced system; and higher accuracy than can be obtained with only an inertial system. This paper presents the results of an analysis of the position, heading, and attitude accuracies which can be obtained using various combinations of inertial and externally referenced systems. A computer simulation was performed to incorporate extensive error models for all of the sensors involved. A 24-state Kalman filter was used to control the errors. In addition, a cost versus performance analysis is presented based on representative subsystem costs and hybridization considerations. GRA

EVALUATION OF ALTERNATIVES FOR AN ARMY PRECISION LANDING SYSTEM Final Report
R. Lancaster, R. Lewsen, and B. Mitchell Sep. 1985 130 p
(Contract DAEA18-84-C-0127)
(AD-A167780; Rept-2959-01-1-3759) Avail: NTIS HC A07/MF A01 CSCL 17/7

This study was conducted to determine the need for Army Precision Landing System requirements for aviation deployment in the combat zone. The study identifies the need and best approaches for satisfying Army requirements within air traffic management functions, applying current tactical doctrine. Existing landing systems are compared with alternate systems not presently developed or fielded from a technical and operational viewpoint. Availability, operational concepts, and cost data are analyzed for each proposed system. The study also developed strengths and weaknesses of the existing, as well as proposed precision landing systems for ATC. Final results and recommendations to support air traffic control requirements on the battlefield beyond the year 2000 are depicted. GRA

The instrument measurement errors in a GPS receiver (a coherent C/A code cross-correlation receiver with carrier phase measurements and higher process gain, capable of using the P code modulated L2 frequency) are studied. The GPS receiver consists of a ZF amplifier, a mixing frequency preparation unit, and a digital signal processing unit including a code generator, a correlator, a numerical oscillator, and control and evaluation computers. The geodetic GPS receiver is analyzed as regards mobility, human factors engineering, interference, possible connections, and independence from external data sources. The cost effective multiplex scheme is selected for simultaneous measurements of four satellites leading to signal delay reduction. A subminiature rubidium standard is used as a receiver black to avoid loss of accuracy at higher integration times. ESA

A FEASIBILITY STUDY FOR THE USE OF ELECTRONIC FLIGHT STRIPS IN AIR TRAFFIC CONTROL (ATC) CONTROLLER WORKSTATIONS
Juergen Grigat and Josef Thomas Oct. 1985 89 p Original language document was announced as N85-31039
(ESA-TT-928; DFVLR-FB-85-08; ESA-86-97572) Avail: NTIS HC A05/MR A01; original German version available from DFVLR, Cologne, West Germany DM 47

Flight progress strip importance in air traffic control was studied and a concept for flight strip representation on electronic displays supported by an automatic data exchange between adjacent control stations and adapted to the ATMOS (Air Traffic Management and Operations Simulator) air traffic control simulator was developed. Data important for executive controllers and for schedule controllers per sector and per flight are displayed on two different screens. The concept allows a rapid exact data exchange to all workstations and a reduction in the controllers data acquisition so that they can dedicate their attention to approach monitoring. Pilot communications are also reduced. The feasibility of the concept is demonstrated in a case study. ESA

IN-FLIGHT PHOTOGRAMMETRIC MEASUREMENT OF WING ICE ACCRETIONS
Robert C. McKnight, Richard L. Palko (Calspan Field Services, Inc., Arnold AFS, Tenn.), and Robert L. Humes 1986 14 p Presented at the 24th Aerospace Sciences Meeting, Reno, Nev., 6-8 Jan. 1986; sponsored by AIAA
(NASA-TM-87191; E-2847; NAS 1.15:87191) Avail: NTIS HC A02/MF A01 CSCL 01C

A photographic instrumentation system was developed for the Lewis icing research aircraft to measure wind ice accretions during flight. The system generates stereo photographs of the accretions which are then photogrammetrically measured by the Air Force Arnold Engineering and Development Center. The measurements yield a survey of spatial coordinates of an accretion's surface to an accuracy of at least + or - 0.08 cm. The accretions can then be matched to corresponding icing cloud and aerodynamic measurements. The system is being used to measure rime, mixed, and clear natural ice accretions. Author

MISSION ADAPTIVE WING SOARS AT NASA FACILITY
Debra Rahn and Leslie Reinertson (National Aeronautics and Space Administration. Dryden (Hugh L.) Flight Research Center, Edwards, Calif.) 29 Aug. 1986 2 p
(P86-10182) Avail: NTIS HC A02/MF A01 CSCL 01C

Research pilots have flown the Mission Adaptive Wing (MAW) aircraft, a highly modified F-111 jet fighter, from subsonic speeds up to Mach 1.4 in initial flight tests. The inital test flights are clearing the envelope with the wings flexed at various curvatures. This process allows further research data to be safely gathered so that designers of future variable camber wing aircraft have the best information possible. The altitude envelope was cleared from 27,500 down to 7,500 feet where denser air can cause more stress on the aircraft. Testing with the aircraft was conducted with wing sweep angles of 26 and 58 degrees. At the conclusion of the performance tests in the manual configuration, the system will be reconfigured for automatic mode tests. The limited automatic modes include maneuver camber control where the wings are deflected automatically to the best lift versus drag combination for a particular speed; cruise camber control which can help protect the aircraft from high G stresses; and maneuver enhancement/gust alleviation which is designed to improve the aircraft's up and down movement response to pilot commands and reduce the aircraft response to turbulence. B.G.

FLIGHT TEST OF PASSIVE WING/STORE FLUTTER SUPPRESSION
F. W. Cazier, Jr. and M. W. Kehoe Aug. 1986 27 p Presented at the 1986 Aircraft/Stores Compatibility Symposium, Wright-Patterson AFB, Ohio, 8-10 Apr. 1986
(NASA-TM-87766; NAS 1.15:87766) Avail: NTIS HC A03/MF A01 CSCL 01C

Flight tests were performed on an F-16 airplane carrying on each wing an AIM-9J wingtip missile, a GBU-8 bomb near midspan, and an external fuel tank. Baseline flights with the GBU-8 mounted on a standard pylon established that this configuration is characterized by an antisymmetric limited amplitude flutter oscillation within the operational envelope. The airplane was then flown with GBU-8 mounted on the decoupler pylon. The decoupler pylon is a NASA concept of passive wing-store flutter suppression achieved by providing a low store-pylon pitch frequency. The decoupler pylon successfully suppressed wing-store flutter throughout the flight envelope. A 37 percent increase in flutter velocity over the standard pylon was demonstrated. Maneuvers with load factors to 4g were performed. Although the static store displacements during maneuvers were not sufficiently large to be of concern, a store pitch alignment system was tested and performed successfully. One GBU-8 was ejected demonstrating that weapon separation from the decoupler pylon is normal. Author

THE APPLICATION OF ENERGY TECHNIQUES TO PROPELLER-DRIVEN AIRPLANES M.S. Thesis
Douglas B. Youngblood Dec. 1985 92 p
(AD-A167113; AFIT/CI/NR-86-53T) Avail: NTIS HC A05/MF A01 CSCL 01/2

This thesis examines the validity of using the energy technique on propeller-driven aircraft during a climb analysis. It compares an accepted subsonic aircraft climb analysis method (pure potential energy increase) with an acceleration analysis procedure (pure kinetic energy increase) that has been a subject of criticism when used within a subsonic flight test program because of aircraft power limitations and flight test assumptions. The energy-state approximation was applied to a subsonic, propeller-driven aircraft using both a sawtooth climb analysis procedure and level acceleration method. Results showed that energy techniques, i.e., correlation between sawtooth and level acceleration methods, are a valuable support tool to the previously isolated potential energy (sawtooth climb) method. Data demonstrated a test time savings of approximately 7:1 with a variance in overall correlation that, although not within acceptable standards, is believed to be reducible with a more dedicated instrumentation selection. Data correlation suggested good agreement on best rate-of-climb speed determination. However, this should be an asset in reducing the time previously required for determination of excess thrust horsepower. Further testing, specifically with the level acceleration method, using higher resolution data acquisition equipment (with possibly an accelerometer) would fully demonstrate the extent of unaccountable losses and resulting disagreement between the two methods. GRA

VULNERABILITY METHODOLOGY AND PROTECTIVE MEASURES FOR AIRCRAFT FIRE AND EXPLOSION HAZARDS. VOLUME 2: AIRCRAFT ENGINE NACELLE FIRE TEST PROGRAMS. PART 1: FIRE DETECTION, FIRE EXTINGUISHMENT AND SURFACE IGNITION STUDIES Final Report, Feb. 1981 - Oct. 1984
A. M. Johnson and A. F. Grenich Jan. 1986 279 p
(Contract F33615-78-C-2063)
(AD-A167356; D180-28861-1; AFWAL-TR-85-2060-V-2-Pt-1) Avail: NTIS HC A13/MF A01 CSCL 01/3

Fire tests and extinguishant concentration tests were conducted using a simulated portion of the F-16 aircraft engine compartment in the Aircraft Engine Nacelle (AEN) fire test simulator at WPAFB. Combat damage simulation included outer compartment wall penetration allowing either inflow or outflow of ventillation airflow through and external wound and fan perforation or engine bleed air line damage. Standard fire and agent concentration test techniques were developed. Existing specifications were found to be adequate in terms of quantity of fire extinguishing agent. Results also indicated that more rapid agent release resulted in more effective use of the agent. Halon 1301 performed significantly better than Halon 1202, contrary to what the available literature indicated. Fires with combat damage inflow simulation added were the most difficult to extinguish because hot surface ignition sources were created soon after the test fire was ignited. For these, the quantity of agent specified would have been adequate only if the agent reached the fire within a few seconds after ignition. GRA

VULNERABILITY METHODOLOGY AND PROTECTIVE MEASURES FOR AIRCRAFT FIRE AND EXPLOSION HAZARDS. VOLUME 1: EXECUTIVE SUMMARY Final Report, Feb. 1981 - Oct. 1984
A. F. Grenich Jan. 1986 40 p
(Contract F33615-78-C-2063)
(AD-A167443; D180-28860-1-Vol-1; AFWAL-TR-85-2060-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 13/12

This report summarizes the research conducted by the contractor on airplane engine compartment and fuel tank fire safety research. The value of ground testing, using the Aircraft Engine Nacelle (AEN) and the Simulated Aircraft Fuel Tank Environment (SAFTE) facilities, was clearly evident as the testing proceeded. Extinguishant tests of simulated nacelle fires indicated that current criteria for extinguishant concentration and duration were more than adequate for intact nacelles inert gas generator systems (OBIGGS) revealed that both the permeable membrane and molecular sieve adequately inerted the test fuel tank. However, some minor operational difficulties were experienced with both test units which would have to be corrected prior to producing flight hardware. GRA

VULNERABILITY METHODOLOGY AND PROTECTIVE MEASURES FOR AIRCRAFT FIRE AND EXPLOSION HAZARDS. VOLUME 2: AIRCRAFT ENGINE NACELLE FIRE TEST PROGRAMS. PART 2: SMALL SCALE TESTING OF DRY CHEMICAL FIRE EXTINGUISHANTS Final Report, Feb. 1981 - Oct. 1984
L. A. Desmarais Jan. 1986 279 p
(Contract F33615-78-C-2063)
(AD-A167444; D180-28862-Vol-2-Pt-2; AFWAL-TR-85-2060-Vol-2-Pt-2) Avail: NTIS HC A13/MF A01 CSCL 01/2

Dry chemical fire extinguishing agents were studied in a simulated small scale aircraft engine nacelle environment to observe the ability of these agents to prevent re-ignition, a known deficiency of the presently used gaseous agents. An injector was developed which effectively dispersed agent into the airstream; a fuel spray behind a flameholder, ignited and sustained by a hot surface, was used as the test scenario. The agents were found to be effective in very small quantities (less than 30 grams) for initial suppression of the fire, but permanent extinguishment was found to be a function of test conditions. The agents tended to accumulate on test surfaces and cause some corrosion as the result of repeated applications but were easily cleaned from affected surfaces. GRA

VULNERABILITY METHODOLOGY AND PROTECTIVE MEASURES FOR AIRCRAFT FIRE AND EXPLOSION HAZARDS. VOLUME 3: ON-BOARD INERT GAS GENERATOR SYSTEM (OBIGGS) STUDIES. PART 2: FUEL SCRUBBING AND OXYGEN EVOLUTION TESTS Final Report, Feb. 1981 - Oct. 1984
P. M. McConnell, G. A. Dalan, and C. L. Anderson Jan. 1986 84 p
(Contract F33615-78-C-2063)
(AD-A167445; AFWAL-TR-85-2060-Vol-3-Pt-2) Avail: NTIS HC A05/MF A01 CSCL 01/2

A basic consideration in designing an on-board inert gas generator system (OBIGGS) is to manage the evolution of dissolved oxygen in the fuel such that an inert ullage is maintained. Fuel scrubbing, in which an inert gas is bubbled through the fuel, is the common method of removing dissolved oxygen. Analytical modeling of the scrub gas requirements for fuel scrubbing required experimental data for validation. Tests were conducted to determine if a model based on the ideal gas law, published solubility coefficients, and partial pressure relationships was valid. The excellent agreement between calculated results and test data verified that such a model is valid. GRA

AERIAL REFUELING EVALUATION OF THE CH-47D HELICOPTER Final Report, 6-9 Aug. 1985
Robert D. Robbins, Patrick J. Sullivan, and Michael K. Herbst Aug. 1985 56 p
(AD-A167575) Avail: NTIS HC A04/MF A01 CSCL 01/3

A feasibility evaluation of aerial refueling the Boeing Vertol CH-47D helicopter (USA S/N 84-24159) equipped with a Boeing Vertol designed prototype aerial refueling system was conducted by the US Army Aviation Engineering Flight Activity (USAAEFA). Aerial refueling operations were performed with an HC-130P tanker aircraft and included a tanker turbulence evaluation, handling qualities while performing refueling procedures, and prototype aerial refueling system operations. Twenty-five refueling probe to drogue engagements were performed. During one engagement, 5070 pounds of fuel were transferred from the tanker to the CH-47D. Six shortcomings, all of which were related to the aerial refueling system, were identified for correction in the production design. The most significant of these was the increased maintenance requirements imposed by the use of refueling probe restraint cables. Within the limited scope of this evaluation aerial refueling of the CH-47D helicopter is a feasible concept. GRA

Trade-off studies were conducted wherein two versions of tilt rotor aircraft were examined to determine optimum mission distances where the tilt rotor designs were superior to a comparable contemporary (pure) helicopter. Two FORTRAN computer programs (VASCOMP 2 and HESCOMP) were used to predict aircraft performance. Program results were validated using data from independent sources. A simplified user's manual is included (with sample data and program output) for VASCOMP 2. The experimental results substantiate that the V-22, designated to replace the CH-46F among other aircraft, will offer significant improvements in speed, loiter endurance, hover endurance, performance, and efficiency. The results lend further credence to the manufacturer's claims that tilt rotor aircraft can transport more passengers/payload over longer distances in less time than conventional helicopters while retaining the important advantage of vertical takeoff and landing. It is acknowledged that the tilt rotor can readily perform transport missions using less fuel than helicopters but if a large percentage of hovering flight is required, conventional rotary wing aircraft are far more efficient from a fuel consumption standpoint. However, they do not have the staying power that the tilt rotor demonstrates. GRA

AIRBORNE INTRUDER DETECTION CONSIDERATIONS
R. P. Syler Feb. 1986 5 p Presented at the Carnahan Conference on Security, Lexington, Ky., 14 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-006462; SAND-85-2236; CONF-860519-4) Avail: NTIS HC A02/MF A01

This paper addresses the considerations the DOE-OSS is giving to the airborne threat to their sensitive facilities. They are working towards establishing prohibited airspace over these facilities and tasked SNL to study the techniques for monitoring this airspace. The SNL study looked at various technologies that might be employed to monitor designated airspace. The results of the study indicate that certain dedicated radar systems are candidates, but that alternatives to these are needed. SNL is presently working on developing a system utilizing FAA ASR data at the DOE facilities, and on a seismic-acoustic helicopter detector system; these are possible alternatives to dedicated radars. TECHNOLOGY DEMONSTRATION FOR INVESTIGATION OF THE NEW POSSIBILITIES OF AMPHIBIOUS FLYING BOATS, PHASE 2 Final Report, Dec. 1984
Gerhard Kriechbaum Bonn, West Germany Bundesministerium

fuer Forschung und Technologie Dec. 1985 201 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-022; ISSN-0170-1339; ESA-86-97466) Avail: NTIS HC A10/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 36.50

The effects of new technologies on the amphibious flying boat open-sea capability, efficiency, and economical and flexible application were studied during a flight test program. Configuration and manufacture are described and technical characteristics are presented. Tests were performed on land, in water (inland water areas) and at sea to determine the corrosion resistance, the effects of the introduction of fiber composite materials in wings, and the all-weather landing procedures for amphibious aircraft. The craft can be used in open sea and does not require a maintenance and overhaul infrastructure, and shows good resistance to corrosion in salty water. The development of shock-absorbing fiber composite material structures is recommended. ESA

INVESTIGATIONS IN LANDING PROCESS OF AIRCRAFT BY MEANS OF THE MONTE-CARLO METHOD
Hanns-Juergen Peters Dec. 1985 109 p Original language document was announced as N86-14269
(ESA-TT-951; DFVLR-FB-85-27; ESA-86-97583) Avail: NTIS HC A06/MF A01; original German version available from DFVLR, Cologne, West Germany DM 35.50

A landing approach simulation model based on the data from a civil airport and on the Monte Carlo theory is developed using the General Purpose Simulation System on FORTRAN 4. The model is improved to investigate the landing process with constant and variable landing times. The theoretical landing time distribution with waiting times verified with the Chi-square test show good agreement with the empirical landing time distribution. The turn time and landing time distribution with waiting time parameters are verified by statistical comparison of the simulated distribution and the empirical one. The efficiency of the test distributions is improved with a relevant landing time delimitation. The test distributions are tested successfully in other airports. ESA

CHARACTERISTICS OF ALTITUDE ERROR AT REDUCED QUANTIZATION Final Report
Gene A. Wong Aug. 1986 33 p
(FAA/PM-86/35) Avail: NTIS HC A03/MF A01 CSCL 01D

An analysis of the impact of reducing the quantization level on the altitude error produced by the altimetry system is described. Specifically, the mean and the standard deviation of the altitude error at the output of the aircraft's onboard quantization device are derived assuming altitude error at its input is normally distributed. The formulae derived are very general, exact, and applicable to all ranges of input statistics and quantization levels. A computer program was written to evaluate the impact of reduced quantization for a wide range of input error standard deviation and several quantization levels. Additionally, a comparison is made between the commonly used and approximate uniform distribution model method and the exact formulae derived herein for calculating the quantized altitude error. FLIGHT DATA RECORDERS (FDR) AND/OR COCKPIT VOICE RECORDERS (CVR) IN THE LOCKHEED ORION P-3C UPDATE 2 [FDR EN/OF CVR IN DE LOCKHEED ORION P-3C UPDATE 2]
J. J. Coorens Jul. 1984 136 p In DUTCH and ENGLISH
(ESA-86-97395) Avail: NTIS HC A07/MF A01

Installation of Flight Data Recorder/Cockpit Voice Recorder (FDR/CVR) combinations in the P-3C Update aircraft is discussed. Requirements, design and development, and feasibility aspects of FDRs and CVRs are treated. Examples of existing systems (e.g., the U.S. Navy Universal Locator Airborne Data Systems, and the solid-state FDR) are given. Aircraft accident relevant information, necessary adaptions of the P-3 aircraft, and feasibility were investigated. Because of the high FDR cable system costs, installation of only a CVR is concluded to be the most feasible solution. ESA

SMALL GAS TURBINE COMBUSTOR EXPERIMENTAL STUDY: COMPLIANT METAL/CERAMIC LINER AND PERFORMANCE EVALUATION
Waldo A. Acosta (Army Aviation Research and Development Command, Cleveland, Ohio) and Carl T. Norgren 1986 16 p Presented at the 22nd Joint Propulsion Conference, Huntsville, Ala., 16-18 Jun. 1986; sponsored by AIAA, ASME, SAE, and ASEE
(NASA-TM-87304; E-3016; NAS 1.15:87304) Avail: NTIS HC A02/MF A01 CSCL 21E

Combustor research relating to the development of fuel efficient small gas turbine engines capable of meeting future commercial and military aviation needs is currently underway at NASA Lewis. As part of this combustor research, a basic reverse-flow combustor has been used to investigate advanced liner wall cooling techniques. Liner temperature, performance, and exhaust emissions of the experimental combustor utilizing compliant metal/ceramic liners were determined and compared with three previously reported combustors that featured: (1) splash film-cooled liner walls; (2) transpiration cooled liner walls; and (3) counter-flow film cooled panels. The use of holographic interferometry to view the small- and large-scale flow field structures in the combustion chamber of a motored Wankel engine assembly is described. In order that the flow patterns of interest could be observed, small quantities of helium were injected with the intake air. Variation of the air flow patterns with engine speed, helium flow rate, and rotor position are described. The air flow at two locations within the combustion chamber was examined using this technique. Author

DESCRIPTION OF A 20 KILOHERTZ POWER DISTRIBUTION SYSTEM
Irving G. Hansen Aug. 1986 7 p Presented at the 21st Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25-29 Aug. 1986; cosponsored by ACS, SAE, ANS, ASME, IEEE, AIAA, and AIChE
(NASA-TM-87346; NAS 1.15:87346) Avail: NTIS HC A02/MF A01 CSCL 21E

A single phase, 440 VRMS, 20 kHz power distribution system with a regulated sinusoidal wave form is discussed. A single phase power system minimizes the wiring, sensing, and control complexities required in a multi-sourced redundantly distributed power system. The single phase addresses only the distribution link; mulitphase lower frequency inputs and outputs accommodation techniques are described. While the 440 V operating potential was initially selected for aircraft operating below 50,000 ft, this potential also appears suitable for space power systems. This voltage choice recognizes a reasonable upper limit for semiconductor ratings, yet will direct synthesis of 220 V, 3 power. A 20 kHz operating frequency was selected to be above the range of audibility, minimize the weight of reactive components, yet allow the construction of single power stages of 25 to 30 kW. The regulated sinusoidal distribution system has several advantages. With a regulated voltage, most ac/dc conversions involve rather simple transformer rectifier applications. A sinusoidal distribution system, when used in conjunction with zero crossing switching, represents a minimal source of EMI. The present state of 20 kHz power technology includes computer controls of voltage and/or frequency, low inductance cable, current limiting circuit protection, bi-directional power flow, and motor/generator operating using standard induction machines. A status update and description of each of these items and their significance is presented. M.G.

AEROPROPULSION OPPORTUNITIES FOR THE 21ST CENTURY
William C. Strack 1986 32 p Presented at the Scenario for 21st Century Aero Engine Design Seminar, Bristol, England, 16-17 May 1986; sponsored by the Institute of Mechanical Engineers
(NASA-TM-88817; E-3177; NAS 1.15:88817) Avail: NTIS HC A03/MF A01 CSCL 21E

A large number of novel aeropropulsion system concepts are presented for subsonic through hypersonic applications offering large potential improvements. Collectively, these examples illustrate the revolutionary opportunities and challenges that could enable truly revolutionary aircraft capabilities in the future. Certainly not all of these concepts will ultimately prove fruitful. Nevertheless, the sheer number of existing concepts, including many unmentioned herein, is so large and the applications so vast, that the prognosis for the future of aeropropulsion is very encouraging indeed. A PARAMETRIC STUDY OF A GAS-GENERATOR AIRTURBO RAMJET (ATR)
Christopher A. Snyder 1986 19 p Presented at the 22nd Joint Propulsion Conference, Huntsville, Ala., 16-18 Jun. 1986; sponsored by AIAA, ASME, SAE and ASEE
(NASA-TM-88808; E-3156; NAS 1.15:88808) Avail: NTIS HC A02/MF A01 CSCL 21E

Parametric engine performance calculations were carried out for an airturbo ramjet (ATR). A LOX-LH2 rocket powered turbine powered the compressor. The engine was flown over a typical flight path up to Mach 5 to show the effect of engine off design operation. The compressor design efficiency, compressor pressure ratio, rocket turbine efficiency, rocket turbine inlet temperature, and rocket chamber pressure were varied to show their effect on engine net thrust and specific impulse at Mach 5 cruise. Estimates of engine weights as a fucntion of the ratio of compressor air to rocket propellant flow and rocket champer pressure are also included. In general, the Mach 5 results indicate that increasing the amount of rocket gas produced increased thrust but decreased the specific impulse. The engine performance was fairly sensitive to rocket chamber pressure, especially at higher compressor pressure ratios. At higher compressor pressure ratios, the engine thrust was sensitive to turbine inlet temperature. At all compressor pressure ratios, the engine performance was not sensitive to compressor or turbine efficiency. Author

AN OVERVIEW OF THE SMALL ENGINE COMPONENT TECHNOLOGY (SECT) STUDIES
M. R. Vanco, W. T. Wintucky, and R. W. Niedzwiecki Jun. 1986 20 p Presented at the 22nd Joint Propulsion Conference, Huntsville, Ala., 16-18 Jun. 1986; cosponsored by AIAA, ASME, SAE, and ASEE
(NASA-TM-88796; E-3131; NAS 1.15:88796; USAAVSCOM-TR-86-C-23; AIAA-86-1542) Avail: NTIS HC A02/MF A01 CSCL 21E

The objectives of the joint NASA/Army SECT Studies were to identify high payoff technologies for year 2000 small gas turbine engine applications and to provide a technology plan for guiding future research and technology efforts applicable to rotorcraft, commuter and general aviation aircraft and cruise missiles. Competitive contracts were awarded to Allison, AVCO Lycoming, Garrett, Teledyne CAE and Williams International. This paper presents an overview of the contractors' study efforts for the commuter, rotorcraft, cruise missile, and auxiliary power (APU) applications with engines in the 250 to 1,000 horsepower size range. Reference aircraft, missions and engines were selected. Advanced engine configurations and cycles with projected year 2000 component technologies were evaluated and compared with a reference engine selected by the contractor. For typical commuter and rotorcraft applications, fuel savings of 22 percent to 42 percent can be attained. For $1/gallon and $2/gallon fuel, reductions in direct operating cost range from 6 percent to 16 percent and from 11 percent to 17 percent respectively. For subsonic strategic cruise missile applications, fuel savings of 38 percent to 54 percent can be achieved which allows 35 percent to 60 percent increase in mission range and life cycle cost reductions of 40 percent to 56 percent. High payoff technologies have been identified for all applications. Author

TURBULENT DISPERSION OF THE ICING CLOUD FROM SPRAY NOZZLES USED IN ICING TUNNELS
C. John Marek and William A. Olsen, Jr. May 1986 17 p Presented at the 3rd International Workshop on Atmospheric Icing of Structures, Vancouver, British Columbia, 6-8 May 1986
(NASA-TM-87316; E-3047; NAS 1.15:87316) Avail: NTIS HC A02/MF A01 CSCL 21E

To correctly simulate flight in natural icing conditions, the turbulence in an icing simulator must be as low as possible. But some turbulence is required to mix the droplets from the spray nozzles and achieve an icing cloud of uniform liquid water content. The goal for any spray system is to obtain the widest possible spray cloud with the lowest possible turbulence in the test section

of a icing tunnel. This investigation reports the measurement of turbulence and the three-dimensional spread of the cloud from a single spray nozzle. The task was to determine how the air turbulence and cloud width are affected by spray bars of quite different drag coefficients, by changes in the turbulence upstream of the spray, the droplet size, and the atomizing air. An ice accretion grid, located 6.3 m downstream of the single spray nozzle, was used to measure cloud spread. Both the spray bar and the grid were located in the constant velocity test section. Three spray bar shapes were tested: the short blunt spray bar used in the NASA Lewis Icing Research Tunnel, a thin 14.6 cm chord airfoil, and a 53 cm chord NACA 0012 airfoil. At the low airspeed (56 km/hr) the ice accretion pattern was axisymmetric and was not affected by the shape of the spray bar. At the high airspeed (169 km/hr) the spread was 30 percent smaller than at the low airspeed. For the widest cloud the spray bars should be located as far upstream in the low velocity plenum of the icing tunnel. Good comparison is obtained between the cloud spread data and predicitons from a two-dimensional cloud mixing computer code using the two equation turbulence (k epsilon g) model. Author

NEW TECHNOLOGY PROPULSION (ANT) FOR GENERAL AVIATION AIRCRAFT, PHASE 1 Final Report, Aug. 1985
Ingo Borchers, Klaus Jonas, Rudolf Matecki, Hubert Kroje, Dieter Welte, and Herbert Zimmer Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 158 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-031; ISSN-0170-1339; ESA-86-97472) Avail: NTIS HC A08/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 32.50

The ANT concept for bimotor-turbopropelled aircraft developed from market-oriented requirements is characterized by two rear propellers and two engines installed inside the fuselage behind the passenger cabin, connected by transmission shafts. The concept is analyzed as regards aerodynamic quality, propeller installation efficiency, noise conditions and propeller load. The analysis is based on theoretical methods and wind tunnel tests with a 1:7 model. The propeller installation efficiency is improved by 10% to 14%. The specific range compared to that of an aircraft with conventional engine aircraft arrangement is increased by 15% and the maximum cruising speed by 7%. The noise level limit can be kept to 85 dB(A) and below. The dynamic behavior of the powerplant and noise should be further investigated. ESA

FLIGHT CONTROL SYNTHESIS FOR FLEXIBLE AIRCRAFT USING EIGENSPACE ASSIGNMENT
John B. Davidson and David K. Schmidt Jun. 1986 230 p (Grant NAG1-254)
(NASA-CR-178164; NAS 1.26:178164) Avail: NTIS HC A11/MF A01 CSCL 01C

The use of eigenspace assignment techniques to synthesize flight control systems for flexible aircraft is explored. Eigenspace assignment techniques are used to achieve a specified desired eigenspace, chosen to yield desirable system impulse residue magnitudes for selected system responses. Two of these are investigated. The first directly determines constant measurement feedback gains that will yield a close-loop system eigenspace close to a desired eigenspace. The second technique selects quadratic weighting matrices in a linear quadratic control synthesis that will asymptotically yield the close-loop achievable eigenspace. Finally, the possibility of using either of these techniques with state estimation is explored. Application of the methods to synthesize integrated flight-control and structural-mode-control laws for a large flexible aircraft is demonstrated and results discussed. Eigenspace selection criteria based on design goals are discussed, and for the study case it would appear that a desirable eigenspace can be obtained. In addition, the importance of state-space selection is noted along with problems with reduced-order measurement feedback. Since the full-state control laws may be implemented with dynamic compensation (state estimation), the use of reduced-order measurement feedback is less desirable. This is especially true since no change in the transient response from the pilot's input results if state estimation is used appropriately. The potential is also noted for high actuator bandwidth requirements if the linear quadratic synthesis approach is utilized. Even with the actuator pole location selected, a problem with unmodeled modes is noted due to high bandwidth. Some suggestions for future research include investigating how to choose an eigenspace that will achieve certain desired dynamics and stability robustness, determining how the choice of measurements effects synthesis results, and exploring how the phase relationships between desired eigenvector elements effects the synthesis results. DEVELOPMENT OF A TAKEOFF PERFORMANCE MONITORING SYSTEM
Raghavachari Srivatsan (Kansas Univ., Lawrence), David R. Downing, and Wayne H. Bryant Aug. 1986 11 p Presented at the AIAA Guidance, Navigation and Control Conference, Williamsburg, Va., 18-20 Aug. 1986
(NASA-TM-89001; NAS 1.15:89001) Avail: NTIS HC A02/MF A01 CSCL 01C

The development and testing of a real-time takeoff performance monitoring system is discussed. The algorithm is madeup of two segments: a pretakeoff segment and a real-time segment. One-time inputs of ambient conditions and airplane configuration information are used in the pretakeoff segment to generate schedule performance data for that takeoff. The real-time segment uses the scheduled performance data generated in the pretakeoff segment, runway length data, and measured parameters to monitor the performance of the airplane throughout the takeoff roll. Airplane and engine performance deficiencies are detected and annunciated. An important feature of this algorithm is the one-time estimation of the runway rolling friction coefficient. The algorithm was tested using a six degree of freedom airplane model in a computer simulation. Results from a series of sensitivity analysis are also included. Author

ON THE HANDLING QUALITIES OF FLIGHT VEHICLES THROUGH VARIABLE FLIGHT CONDITIONS M.S. Thesis
Kenneth C. Green Jan. 1986 100 p
(AD-A167727; AFIT/CI/NR-86-56T) Avail: NTIS HC A05/MF A01 CSCL 20/4

Specifications of flight vehicle handling qualities are currently based on the solution of linear, constant coefficient equations of motion, even when certain flight vehicles encounter continuously varing conditions in parts or all of their flight regime. This thesis develops an approach to encompass flight vehicle dynamics that vary during the performance of piloted tasks in the specification of handling qualities. Asymptotic methods, particularly Generalized Multiple Scales, are used to develop approximate analytical solutions to time-varying equations of motion. The solutions are valid throughout the time of variation, with constant flight conditions as a special case. Two classes of flight vehicles are examined to demonstrate the application of asymptotic methods to obtaining parameters pertinent to handling quality analyses. Extensions to existing criteria are suggested. This treatment of variable dynamics can give a clearer understanding of the response characteristics, and therefore of the stability and control requirements, of many piloted vehicles. GRA

ON CONTROL CONCEPT FOR IN-FLIGHT SIMULATION INCLUDING ACTUATOR NONLINEARITIES AND TIME DELAYS
Frohmut Hebschel Nov. 1985 67 p Original language document was announced as N86-10047
(ESA-TT-946; DFVLR-FB-85-24; ESA-86-97581) Avail: NTIS HC A04/MF A01; original German version available from DFVLR, Cologne, West Germany DM 23.50

A model-following system was developed to study the dynamic behavior of transport aircraft with reduced longitudinal stability. The system is divided into two parts. The first consists of feedforward branches. If a linear description of the model and the basic aircraft is assumed an exact model-following is achieved by this part. For the control matrices algebraic expressions are derived. In the equations the influence of actuator dynamics is considered. A set of formulas in which all variables are assumed to be discretized for processing on a digital computer is developed. By the second subsystem an error suppression is achieved. The application of a cost vector method is demonstrated for one example. It is shown that nonlinearities and time lags can be included in the calculation of the feedback gains. ESA

AIRFOIL FLUTTER MODEL SUSPENSION SYSTEM Patent Application
Wilmer H. Reed, III, inventor (to NASA) (DEI-Tech, Inc., Newport News, Va.) Filed 30 Jul. 1986 14 p
(Contract NAS1-17686)
(NASA-Case-LAR-13522-1; US-Patent-Appl-SN-890575) Avail: NTIS HC A02/MF A01 CSCL 14B

The invention is a wind tunnel suspension system for testing flutter models under various loads and at various angles of attack. The invention comprises a mounting bracket assembly affixing the suspension system to the wind tunnel, a drag-link assembly and a compound spring arrangement. The compound spring arrangement comprises a plunge spring working in opposition to a compressive spring so as to provide a high stiffness to trim out steady state loads and simultaneously a low stiffness to dynamic loads. By this arrangement an airfoil may be tested for oscillatory response in both plunge and pitch modes while being held under high lifting loads in a wind tunnel. NASA

OPERATING ENVELOPE CHARTS FOR THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC WIND TUNNEL
Rosemary A. Rallo, David A. Dress, and Henry J. A. Siegle Aug. 1986 23 p
(NASA-TM-89006; NAS 1.15:89008) Avail: NTIS HC A02/MF A01 CSCL 14B

To take full advantage of the unique Reynolds number capabilities of the 0.3-meter Transonic Cryogenic Tunnel (0.3-m TCT) at the NASA Langley Research Center, it was designed to accommodate test sections other than the original, octagonal, three-dimensional test section. A 20- by 60-cm two-dimensional test section was installed in 1976 and was extensively used, primarily for airfoil testing, through the fall of 1984. The tunnel was inactive during 1985 so that a new test section and improved high speed diffuser could be installed in the tunnel circuit. The new test section has solid adaptive top and bottom walls to reduce or eliminate wall interference for two-dimensional testing. The test section is 33- by 33-cm in cross section at the entrance and is 142 cm long. In the planning and running of past airfoil tests in the 0.3-m TCT, the use of operating envelope charts have proven very useful. These charts give the variation of total temperature and pressure with Mach number and Reynolds number. The operating total temperature range of the 0.3-m TCT is from about 78 K to 327 K with total pressures ranging from about 17.5 psia to 88 psia. This report presents the operating envelope charts for the 0.3-m TCT with the adaptive wall tes t section installed. They were all generated based on a 1-foot chord model. The Mach numbers vary from 0.1 to 0.95. Author

FIELD PERFORMANCE OF FIBER-REINFORCED CONCRETE AIRFIELD PAVEMENTS Final Report, Jan. 1983 - Jan. 1985
Raymond S. Rollings Jul. 1986 53 p
(Contract DTFA01-83-Y-30606)
(FAA/PM-86/26; WES-TR-GL-86-11) Avail: NTIS HC A04/MF A01

A field survey of steel fiber-reinforced concrete airfield pavements found the most serious performance problem to be permanent, early age curl of slabs and associated cracking. An examination of possible causes of this curl indicates it is probably due to the use of large slabs and thin sections. This study recommends slab sizes which should minimize this problem in the future. Other identified performance problems unique to this type pavement include loose surface fibers and nonfunctioning contraction joints. The design criteria for fiber-reinforced concrete were reviewed, and new criteria are proposed that are compatible with the Corps of Engineers change in portland cement concrete design criteria. A new method of overlay design was also proposed. Author

INVESTIGATION ON REDUCTION OF FLOW NOISE OF THE 0.6m X 0.6m TRISONIC WIND TUNNELS
Qilin Yun 28 Mar. 1986 25 p Transl. into ENGLISH from Kongqidonglixue Xuebao (China), no. 2, 1985 p 51-60 Original language document was announced in IAA as A85-38968
(AD-A166302; FTD-ID(RS)T-0034-86) Avail: NTIS HC A02/MF A01 CSCL 20/1

A significant reduction of the tunnel flow noise was achieved and the noise level has been among the lowest of the intermittent wind tunnels both at home and abroad by adding a noise-reducing device after the pressure regulating valve. Mounting screens on the perforated walls in the test section permitted further reduction of the flow noise in the section. It has been shown however, that the screen-mounting technique on the walls needs to be improved. GRA

DESIGN OF A VERTICAL THRUST STAND FOR A REMOTELY PILOTED MODEL HELICOPTER M.S. Thesis
Theodore J. Urda Mar. 1986 42 p
(AD-A167811) Avail: NTIS HC A03/MF A01 CSCL 14/2

This paper discusses the necessary functional characteristics for the design of a test stand to measure the vertical thrust of a remotely piloted model helicopter as a function of power output, in different degrees of ground effect. A number of potential design choices are presented along with possible instrumentation schemes to obtain both the power output and the lifting force generated by

the Heli-Star model helicopter equipped with a Gold Cup HP.61 engine. Included are the results of preliminary validation testing of the test stand design chosen and a discussion of the methods used to eliminate or control vibrations which hampered the utility of the test stand. Recommendations for possible future modifications are also included. GRA

APPLICATIONS OF INFRARED THERMOGRAPHY IN CONVECTIVE HEAT TRANSFER M.S. Thesis
Timothy M. Spence Mar. 1986 69 p
(AD-A167872) Avail: NTIS HC A04/MF A01 CSCL 21/5

A full-scale model of a double-wedge, simulating a jet vane used in guided missile thrust vector control (TVC), was constructed for subsonic wind tunnel testing to evaluate the feasibility of using a thermal imaging (infrared) system vice thermocouples to determine a surface heat transfer coefficient. The model was preheated, then allowed to cool via forced convection to ambient conditions. Surface temperature readings were taken using thermocouples and a thermal imaging system during the cooldown process. These readings were then reduced to solve for a heat transfer coefficient (h), using Newton's Law of Cooling. The results were compared with the theoretical solution for a flat plate and with the results obtained by testing an actual TVC vane configuration under the identical flow conditions. GRA

A VISIT TO CHINA'S FIRST DOMESTIC MADE FIGHTER FLIGHT SIMULATOR
Xin Ri 6 May 1986 5 p Transl. into ENGLISH from Hangkong Zhishi (China), no. 1, 1984 p 4-5
(AD-A167898; FTD-ID(RS)T-0884-85) Avail: NTIS HC A02/MF A01 CSCL 05/9

China's first domestic made fighter flight simulator underwent official state evaluation and was put into service with the Air Force. The flight simulator is made up primarily of three components: the computer room, the fuselage room and the scenery viewing room; the movable simulator cockpit; and the scenery system. The fuselage room is center stage of the entire simulator. The drill and instruction of flight students and the flight training of aircrews is all done here. GRA

AIRCREW TRAINING DEVICES: UTILITY AND UTILIZATION OF ADVANCED INSTRUCTIONAL FEATURES. PHASE III: ELECTRONIC WARFARE TRAINERS Final Report, May - Sep. 1984
Donald J. Polzella and David C. Hubbard Apr. 1986 71 p
(Contract F33615-81-C-0005)
(AD-A167922; AFHRL-TR-85-49) Avail: NTIS HC A04/MF A01 CSCL 05/9

An aircrew training device (ATD) is not merely a flight simulator. It is also equipped with sophisticated hardware and software capabilities, known as advanced instructional features (AIFs), that permit a simulator instructor to control, monitor and fabricate simulator training missions. This report describes the third phase of a three-phase project designed to determine the utility and utilization of AIFs by means of a survey of simulator instructors from the Air Force Major Commands. Phase I surveyed 134 instructor pilots and weapons director instructors assigned to principal Tactical Air Command (TAC) ATD training sites. Phase II surveyed 273 instructor pilots, flight engineers, and radar/navigators from Air Training Command (ATC), Military Airlift Command (MAC), and Strategic Air Command (SAC). Phase III extended the survey to 155 electronic warfare and aerial gunnery instructors from ATC, SAC, and TAC training facilities. Based on utility and utilization ratings, the T-5 and T-4 trainers were the most favorably evaluated devices surveyed. They were followed, in order, by the F-4G simulator, B-52 weapon system trainer, and A-10 simulator. The level of AIF use was affected somewhat by hardware and software unreliability, implementation time, functional limitations, and design deficiencies. GRA

AIRPORT NOISE CONTROL STRATEGIES
Patricia A. Cline May 1986 126 p
(AD-A167977; FAA-EE-86-02) Avail: NTIS HC A07/MF A01 CSCL 20/1

The Federal Aviation Administration's (FAA) Airport Noise Control Strategies Data File contains a comprehensive listing of airport noise control actions. The information contained in this data file is an updated version of the June 1983 Airport Noise Control Strategies report. Originally, the data were collected from the Environmental Data Bank of March 1979, the National Business Aircraft Association and the Aircraft Operators Council International. Additional data were garnered from the FAA Airport Facility Directory. For this version, the FAA regional offices reviewed the latest information and made appropriate changes. Thirty-seven categories of noise control actions have been identified and are in use, singly or in combination, by approximately 400 airports. GRA

QUALITY DETERMINATION OF THE HEAT AND FLOW THEORY DEPARTMENT (WS) SUBSONIC WIND TUNNEL AND EXPERIMENTS USING LASER DOPPLER VELOCITY MEASUREMENT Ph.D. Thesis [KWALITEITSBEPALING VAN DE WS SUBSONE WINDTUNNEL EN EXPERIMENTEN HIERIN MET LASER-DOPPLER SNELHEIDSMETING]
Hans vanWolferen Jul. 1984 97 p In DUTCH
(ESA-86-97355) Avail: NTIS HC A05/MF A01

Wind tunnel characteristics, i.e., the static pressure distribution along the tunnel axis, ventilator characteristics, and quality of the measurement section determined by the velocity distribution and turbulence level, were investigated using pressure and hot-wire velocity measurements. The utility of laser Doppler anemometers (LDA) in the tunnel was examined using a two-beam and real-fringe formation. The photomultiplier detector signal was processed with a digital autocorrelator. The best formation for an optimal correlation function was determined. Autocorrelation processing of velocity and turbulence was performed. The spectral density of the LDA signal was determined from the autocorrelation function with the maximum entropy method. The spectral analysis was tested with test signals and the LDA results in the wake of a cylinder at a Reynolds number of 15,000 to 45,000. ESA

A weight and balance measuring facility incorporating shear stress sensors was developed and studied as regards accuracy, stability and applicability. The sensor system measures shear stress on the landing gear frame or on the nose landing gear tire axis. The construction, efficiency, maneuverability, and interfaces on the shear stress system are described. The causes of hysteresis in the measuring systems at the nose landing gear are experimentally investigated. The facility can be applied to series measurement. ESA

SPACE AND DEFENSE [ESPACE ET DEFENSE]

5 Dec. 1985 29 p In FRENCH Presented at Journee Nationale Science et Defense, Palaiseau, France, 5 Dec. 1985 Prepared in cooperation with Direction des Recherches Etudes et Techniques (ESA-86-97272) Avail: Issuing Activity

The problems of detecting and destroying missiles using satellites with energy weapons are discussed. The analysis of the satellite system shows that a large number of satellites (over 100) are necessary to assure the simultaneous presence of 5 satellites over the region to be defended. The minimum time requirement for the development of such a strategic defense system is 25 yr. The potentials of several types of weapons are examined, showing that the most promising system is a chemical laser in the infrared. Such a laser could be developed in 10 yr to produce megawatts of continuous energy with an effective range of 1500 km. It is concluded that because of the severe development problems and the basic nature of the system itself it is quite probable that complete protection cannot be assured. ESA

FEASIBILITY STUDY OF SURVEILLANCE AVOIDANCE DURING THE DEPLOYMENT OF SOVIET PAYLOADS OF MILITARY INTEREST INTO ORBIT FROM A SOVIET SHUTTLE M.S. Thesis
Edward F. Faudree, Jr. Dec. 1985 85 p
(AD-A167661; AFIT/GSO/ENS/85D-9) Avail: NTIS HC A05/MF A01 CSCL 17/9

The purpose of this thesis was to start a line of inquiry into how well the North American Aerospace Defense Command's (NORAD) radars can detect a satellite deployment from a Soviet space shuttle, one that is comparable to the U.S. space shuttle in size and capability. The radar locations and capabilities were assumed to be the ones presently operating plus a new PAVE PAWS radar in Texas and a new mechanical tracker on the island of Saipan. All radars were assumed to be in working order, and tracking the shuttle. The shuttle was assumed to be launched in a 51.62 deg. inclination, and would attempt deployment only at an ascending or descending node. The satellite could move away from the shuttle along the shuttle's radius vector, velocity vector, or angular momentum vector, so that it is approximately 50 kilometers from the shuttle one half an orbital revolution later. The geocentric angular separation, absolute distance apart and range difference is calculated when the pair are closest to the radar. The elevation angle above the radar's horizon is estimated, and assuming the worst-cas e viewing geometry of the shuttle and satellite by the radar site, a topocentric range difference and angular separation are determined. These values of angle and distance are compared to that particular radar's capabilities. GRA

INTERDIFFUSION !!! BINARY SALT MELTING UNDER WEIGHTLESSNESS Final Report, Jan. 1984
Juergen Hermanns, Achim Hahne, Wilhelm Merkens, and Joachim Richter Bonn, West Germany Bundesministerium fuer Forschung und Technologie Dec. 1985 106 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-017; ISSN-0170-1339; ESA-86-97461) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 22.50

A laboratory facility based on the plane source method was used to measure interdiffusion coefficients of binary alkaline and silver nitrate melts depending on the concentration at 300C using an interpolation interferometer. The applicability of the flowing junction cell under reduced gravity is demonstrated. Gas bubbles resulting from the reaction of the melt with the sealing material show a laminar flow in the measuring cell. After venting of the cell through a large gas bubble the melt forms a tight boundary. The flowing junction cell facility was improved to increase its operating reliability and to reduce the test duration. The concentration difference between melts can be reduced to 1 mole % through hydrodynamic boundary production to increase measurement accuracy. ESA

STUDY OF A HOMOTOPY CONTINUATION METHOD FOR EARLY ORBIT DETERMINATION WITH THE TRACKING AND DATA RELAY SATELLITE SYSTEM (TDRSS)
R. L. Smith (Computer Sciences Corp., Beltsville, Md.) and C. Huang Washington Mar. 1986 140 p
(NASA-TM-86230; NAS 1.15:86230) Avail: NTIS HC A07/MF A01 CSCL 22B

A recent mathematical technique for solving systems of equations is applied in a very general way to the orbit determination problem. The study of this technique, the homotopy continuation method, was motivated by the possible need to perform early orbit determination with the Tracking and Data Relay Satellite System (TDRSS), using range and Doppler tracking alone. Basically, a set of six tracking observations is continuously transformed from a set with known solution to the given set of observations with unknown solutions, and the corresponding orbit state vector is followed from the a priori estimate to the solutions. A numerical algorithm for following the state vector is developed and described in detail. Numerical examples using both real and simulated TDRSS tracking are given. A prototype early orbit determination algorithm for possible use in TDRSS orbit operations was extensively tested, and the results are described. Preliminary studies of two extensions of the method are discussed: generalization to a least-squares formulation and generalization to an exhaustive global method. Author

POINT-MASS SIMULATION TOOL (PMAST) USER'S MANUAL
D. E. Salguero Mar. 1986 181 p

(Contract DE-AC04-76DP-00789)
(DE86-009547; SAND-85-2039) Avail: NTIS HC A09/MF A01

The Point-Mass Simulation Tool (PMAST) is designed to meet the need for a comprehensive conceptual-level trajectory analysis tool that is easy to use. Three degree-of-freedom equations of motion that simulate the flight vehicle as a point mass are used to compute the trajectories. Guidance commands input by the user control the vehicle so that it performs the desired maneuvers. During the development of PMAST, special attention was given to the input and output data formats in an effort to make the code easy to use. This manual describes the format of the input and output data files, and it shows how to execute the program on both the VAX and CRAY computer systems. DOE

AN ANALYSIS OF THE CENTAUR GROUND PROCESSING SYSTEM AT THE KENNEDY SPACE CENTER/CAPE CANAVERAL AFS M.S. Thesis
John T. Brock Dec. 1985 299 p
(AD-A167123; AFIT/GSO/ENS/85D-3) Avail: NTIS HC A13/MF A01 CSCL 16/1

This project determined the capability and limitations of the new Shuttle/Centaur ground processing system at the Kennedy Space Center/Cape Canaveral AFS FL. In particular, it investigates whether or not the system could process four Centaur vehicles in a one year period. To determine the system's capability two tools were developed: a PERT network graph and a SLAM simulation model of the system. The output from these two sources formed the basis for the analysis of the system. The PERT network was constructed using data from the Centaur Program Office and from Cape Canaveral AFS FL. The critical path through the network was also identified. Analysis of the PERT network indicated that it will take over 230 days to process one Centaur vehicle and that there is no slack time in the processing schedule. The SLAM model was built for the proposed system and simulation runs were conducted using versions of the processing system with modified elements, i.e., increased facilities. These runs indicated that additional resources must be procured if the system is to reach four flight per year processing rate. As currently configured, the system can support only two flights a year. GRA

RAIL INDUCTANCE CALCULATIONS FOR SOME SIMPLE CURRENT DISTRIBUTIONS
V. Kowalenko Feb. 1986 44 p
(AD-A167915; MRL-R-976) Avail: NTIS HC A03/MF A01 CSCL 20/3

In this study, an expression for the inductance per unit length of the rails for a railgun-type electromagnetic launcher (EML) is derived from first principles using simple quasi-stationary models for the current distribution in the rails. The results are applied in particular, to the MRL railgun and are compared with work by others in the field. The study concludes with discussions on the problems associated with current diffusion in the rails, and the resulting influence upon the equation-of-motion used in evaluating projectile performance. CENTAUR ENGINE GIMBAL FRICTION CHARACTERISTICS UNDER SIMULATED THRUST LOAD
James W. Askew Sep. 1986 21 p
(NASA-TM-87335; E-3080; NAS 1.15:87335) Avail: NTIS HC A02/MF A01 CSCL 20H

An investigation was performed to determine the friction characteristics of the engine gimbal system of the Centaur upper stage rocket. Because the Centaur requires low-gain autopilots in order to meet all stability requirements for some configurations, control performance (response to transients and limit-cycle amplitudes) depends highly on these friction characteristics. Forces required to rotate the Centaur engine gimbal system were measured under a simulated thrust load of 66,723 N (15,000 lb) and in an altitude/thermal environment. A series of tests was performed at three test conditions; ambient temperature and pressure, ambient temperature and vacuum, and cryogenic temperature and vacuum. Gimbal rotation was controlled, and tests were performed in which rotation amplitude and frequency were varied by using triangular and sinusoidal waveforms. Test data revealed an elastic characteristic of the gimbal, independent of the input signal, which was evident prior to true gimbal sliding. The torque required to initiate gimbal sliding was found to decrease when both pressure and temperature decreased. Results from the low amplitude and low frequency data are currently being used in mathematically modeling the gimbal friction characteristics for Centaur autopilot performance studies. M.G.

STS (SPACE TRANSPORTATION SYSTEM) EXPERIMENT SUPPORT STRUCTURE NEEDS ASSESSMENT
Wallace A. Beauchamp Apr. 1986 42 p
(AD-A167859; ACSC-86-0230) Avail: NTIS HC A03/MF A01 CSCL 22/1

The DOD space-based research and development program has a growing dependence on the Space Transportation System (STS). A shortfall in STS experiment support structures impedes the flight of the DOD payloads. This study looks at the existing support system from a management perspective in order to develop a procurement strategy for additional experiment support structures. The study concludes that a major problem is the existing NASA manifesting system. It recommends procurement of a flexible support structure and increased inventories of NASA sponsored carriers. The increased support includes funding for additional hardware and manpower for NASA. Author (GRA)

ACTS EXPERIMENTS PROGRAM
Ronald J. Schertler 1986 12 p Proposed for presentation at Globecom '86, Houston, Tex., 1-4 Dec. 1986; sponsored by the Institute of Electrical and Electronics Engineers
(NASA-TM-88820; E-3182; NAS 1.15:88820) Avail: NTIS HC A02/MF A01 CSCL 17B

An overview of the ACTS Experiments Program is presented.

ACTS is being developed and will flight test the advanced technologies associated with: a Ka-band multibeam antenna, onboard signal processing and switching as well as laser communications. A nominal 3 yr experiments program is planned. Through the experiments program, the capabilities of the ACTS system will be made available to U.S. industry, university and government experimenters to test, prove the feasibility and evaluate the key ACTS system technologies. Communication modes of operation using the baseband processor and microwave switch matrix are presented, along with the antenna coverage pattern. Potential experiment categories are also presented and briefly discussed. An overall schedule of activities associated with the experiments program is outlined. Results of the ACTS Experiments Program will provide information vital to successful industry implementation of ACTS technology in a future operational system. Author

SOLICITED PROPOSAL FOR A NAVSAT CONTROL SEGMENT HARMONIZATION STUDY
O. B. M. Pietersen, J. Ryan, and F. Visser 1985 41 p
(NLR-Memo-RS-85-020-L; ESA-86-97781) Avail: Issuing Activity

A proposal to harmonize two studies on the Navsat Control Segment, carried out by Racal-Decca Advanced Development Ltd, under ESA contract number 5501/83/F/RD(SC), with a subcontract to Delft University of Technology, is made. The two studies diverge quite considerably because of differences in the baseline system concept, different emphases and different decisions taken for technical solutions. It is believed that discrepancies can be harmonized by discussions between NLR and Racal-Decca, while recommendations can be given to solve remaining differences. ESA

PRELOADED SPACE STRUCTURAL COUPLING JOINTS Patent Application
Marvin D. Rhodes, inventor (to NASA) Filed 30 Jul. 1986 16 p
(NASA-Case-LAR-13489-1; US-Patent-Appl-SN-890445) Avail: NTIS HC A02/MF A01 CSCL 22B

This invention relates to a coupling device for tubular members, of large truss structures, with a locking collar being the only moving part. Each tubular member is constructed with an end bell section that has a belled flange with a mating face, and a necked area which is smaller in diameter than the tubular members to be joined. A split ring is affixed to each tubular member and is constructed so that when two tubular members are laterally moved into axial alignment and the collar is rotated thereover, the split ring loads the joint with axial force by pressing the belled flange mating surfaces together, and a preloading force is provided by the collar mating with a taper on the outside of the split rings. All free play is thereby removed by preloaded force. A major object of the invention is to provide an ability to remove and replace individual tubular members without disturbing other structural parts of a truss structure. An additional anticipated use of this joint is to couple high pressure fluid lines. NASA

THE INVESTIGATION OF TETHERED SATELLITE SYSTEM DYNAMICS Quarterly Report, 15 Feb. - 14 May 1986
Enrico C. Lorenzini Jun. 1986 113 p
(NASA-CR-178895; NAS 1.26:178895; QR-7) Avail: NTIS HC A06/MF A01 CSCL 22B

The analysis of the rotational dynamics of the satellite was focused on the rotational amplitude increase of the satellite, with respect to the tether, during retrieval. The dependence of the rotational amplitude upon the tether tension variation to the power 1/4 was thoroughly investigated. The damping of rotational oscillations achievable by reel control was also quantified while an alternative solution that makes use of a lever arm attached with a universal joint to the satellite was proposed. Comparison simulations between the Smithsonian Astrophysical Observatory and the Martin Marietta (MMA) computer code of reteival maneuvers were also carried out. The agreement between the two, completely independent, codes was extremely close, demonstrating the reliability of the models. The slack tether dynamics during reel jams was analytically investigated in order to identify the limits of applicability of the SLACK3 computer code to this particular case. Test runs with SLACK3 were also carried out. Author

NASA TO LAUNCH NOAA-G WEATHER SATELLITE
Jim Kukowski, Bud Littin, and Jim Elliott 19 Aug. 1986 11 p
(NASA-TM-89245; NASA-News-Release-86-115; P86-10175; NAS 1.15:89245) Avail: NASA Scientific and Technical Information Facility, P.O. Box 8757, BWI Airport, Md. 21240 CSCL 22B

A meteorological weather satellite, NOAA-G, is scheduled to be launched from Vandenberg Air Force Base, Calif., aboard a U.S. Air Force Atlas-E launch vehicle, no earlier than 11:47 a.m., EDT, August 30. The satellite, a third-generation operational weather satellite, will be placed into a near-polar orbit at an altitude of 518 miles. The spacecraft, NOAA-10 in orbit, will circle the globe 14 times each day observing a different position of the Earth's surface on each revolution as the Earth turns beneath the spacecraft's orbit. It will become the morning satellite, joining NOAA-9, in NOAA's two polar orbit satellite system. The satellite's orbital period will be approximately 101 minutes. The orbit is planned to be Sun synchronous so that the spacecraft will cross the equator at approximately 7:30 a.m. (southbound) and 7.30 p.m. (northbound), local solar time. Like other NOAA satellites, NOAA-G will collect meteorological data and transmit the information directly to users around the world to enhance local weather analysis and forecasting. In addition to assisting in local weather forecasting, the satellite data are used for hurricane tracking and warning, and for agricultural, commercial fishing, forestry, maritime and other industrial uses. EFFECT OF AN OXYGEN PLASMA ON THE PHYSICAL AND CHEMICAL PROPERTIES OF SEVERAL FLUIDS FOR THE LIQUID DROPLET RADIATOR
Daniel A. Gulino and Carolyn E. Coles 1986 12 p Proposed for presentation at the 25th Aerospace Sciences Meeting, Reno, Nev., 12-15 Jan. 1987; sponsored by the American Institute of Aeronautics and Astronautics
(NASA-TM-88839; E-3222; NAS 1.15:88839) Avail: NTIS HC A02/MF A01 CSCL 07D

The Liquid Droplet Radiator is one of several radiator systems currently under investigation by NASA Lewis Research Center. It involves the direct exposure of the radiator working fluid to the space environment. An area of concern is the potential harmful effects of the low-Earth-orbit atomic oxygen environment on the radiator working fluid. To address this issue, seven candidate fluids were exposed to an oxygen plasma environment in a laboratory plasma asher. The fluids studied included Dow Corning 705 Diffusion Pump Fluid, polymethylphenylsiloxane and polydimethlsiloxane, both of which are experimental fluids made by Dow Corning, Fomblin Z25, made by Montedison, and three fluids from the Krytox family of fluids, Krytox 143AB, 1502, and 16256, which are made by DuPont. The fluids were characterized by noting changes in visual appearance, physical state, mass, and infrared spectra. Of the fluids tested, the Fomblin and the three Krytoxes were the least affected by the oxygen plasma. The only effect noted was a change in mass, which was most likely due to an oxygen-catalyzed deploymerization of the fluid molecule. Author

IN-FLIGHT ATTITUDE ESTIMATION AND CONTROL EXPERIMENTS WITH IRAS BASED ON MODERN CONTROL THEORY
A. P. Terpstra, T. Zwartbol, and C. P. R. C. Slippens 19 Apr. 1984 104 p
(Contract NIVR-1998)
(NLR-TR-84029-U; B8665727; ESA-86-98035) Avail: NTIS HC A06/MF A01

In three in-flight experiments with IRAS, algorithms for spacecraft state estimation and attitude control, and for inertial-optical attitude determination were loaded from the ground into the IRAS on-board computer and tested. The estimation and control experiments show that the model following control concept can be applied successfully to maneuvering spacecraft like IRAS and can be used with any type of closed-loop regulator. The inertial-optical attitude determination experiment demonstrates the feasibility of in-orbit estimation of gyro drift using measurements by an absolute attitude sensor. ESA

DYNAMICS OF FLEXIBLE SPACECRAFT: AN ANALYSIS OF APPROACHES TOWARDS MATHEMATICAL MODEL ORDER REDUCTION
P. Th. L. M. vanWoerkom 16 Apr. 1985 202 p
(Contract NIVR-1910)
(NLR-TR-85068-U; B8665500; ESA-86-98038) Avail: NTIS HC A10/MF A01

Reduction of the mathematical order (i.e., of the mathematical complexity) of the open loop spacecraft dynamics model with minimal loss of model accuracy is discussed. Approaches to open loop model order reduction were analyzed regarding application to dynamic models of flexible spacecraft. Parameter optimization, aggregation, singular perturbation, modal dominance, and component cost analysis were compared. The latter two approaches appear to be most meaningful and convenient amongst the five. ESA

(Contract ESTEC-3843/79-NL-DG(SC))
(Rept-209-DT-54-Vol-1; ESA-CR(P)-2155-Vol-1; ESA-86-97486-Vol-1) Avail: NTIS HC A08/MF A01

A standard procedure for the calibration of pencil beam IR sensors, based on a simplified laboratory test program that, in conjunction with a suitable software, allows the determination of the unit's operative characteristics in standard laboratory conditions, was developed. The sensor parameters so defined, processed by a computer program together with other input parameters available at the spacecraft control operative center, provide an effective use of the sensor for attitude reconstruction beyond the conditions simulated in laboratory. The procedure simplifies the required tests, and gives better accuracy thanks to the quantity of the available input data processed by the computer. ESA

TEST PROGRAM TO PROVIDE CONFIDENCE IN LIQUID OXYGEN COOLING OF HYDROCARBON FUELED ROCKET THRUST CHAMBERS
Elizabeth S. Armstrong 1986 11 p Presented at the JANNAF Propulsion Meeting, New Orleans, La., 25-28 Aug. 1986

(NASA-TM-88816; E-3174; NAS 1.15:88816) Avail: NTIS HC A02/MF A01 CSCL 21H

An experimental program has been planned at the NASA Lewis Research Center to build confidence in the feasibility of liquid oxygen cooling for hydrocarbon fueled rocket engines. Although liquid oxygen cooling has previously been incorporated in test hardware, more runtime is necessary to gain confidence in this concept. In the previous tests, small oxygen leaks developed at the throat of the thrust chamber and film cooled the hot-gas side of the chamber wall without resulting in catastrophic failure. However, more testing is necessary to demonstrate that a catastrophic failure would not occur if cracks developed further upstream between the injector and the throat, where the boundary layer has not been established. Since under normal conditions cracks are expected to form in the throat region of the thrust chamber, cracks must be initiated artificially in order to control their location. Several methods of crack initiation are discussed in this report. Four thrust chambers, three with cracks and one without, should be tested. The axial location of the cracks should be varied parametrically. Each chamber should be instrumented to determine the effects of the cracks, as well as the overall performance and durability of the chambers. Author

SPACE STATION PROPULSION TECHNOLOGY Annual Progress Report, 24 May 1985 - 23 May 1986

G. L. Briley 1986 92 p

(Contract NAS8-36418)

(NASA-CR-178897; NAS 1.26:178897; RI/RD86-226; Rept-0737p-105-; APR-1) Avail: NTIS HC A05/MF A01 CSCL 21H

The progress on the Space Station Propulsion Technology Program is described. The objectives are to provide a demonstration of hydrogen/oxygen propulsion technology readiness for the Initial Operating Capability (IOC) space station application, specifically gaseous hydrogen/oxygen and warm hydrogen thruster concepts, and to establish a means for evolving from the IOC space station propulsion to that required to support and interface with advanced station functions. The evaluation of concepts was completed. The accumulator module of the test bed was completed and, with the microprocessor controller, delivered to NASA-MSFC. An oxygen/hydrogen thruster was modified for use with the test bed and successfully tested at mixture ratios from 4:1 to 8:1. B.G.

SLIP CASTING AND EXTRUDING SHAPES OF RHENIUM WITH METAL OXIDE ADDITIVES. 1: FEASIBILITY DEMONSTRATION

Francis A. Barr and Russell J. Page Apr. 1986 17 p

(Contract NAS3-23884)

(NASA-CR-174970; NAS 1.26:174970) Avail: NTIS HC A02/MF A01 CSCL 11F

The feasibility of fabricating small rhenium parts with metal oxide additives by means of slip casting and extrusion techniques is described. The metal oxides, ZrO_2 and HfO_2 were stabilized into the cubic phase with Y_2O_3. Additions of metal oxide to the rhenium of up to 15 weight percent were used. Tubes of 17 mm diameter with 0.5 mm walls were slip cast by adapting current ceramic oxide techniques. A complete cast double conical nozzle demonstrated the ability to meet shapes and tolerances. Extrusion of meter long tubing lengths of 3.9 mm o.d. x 2.3 mm i.d. final dimension is documented. Sintering schedules are presented to produce better than 95% of theoretical density parts. Finished machining was found possible were requried by electric discharge machining and diamond grinding. Author

N86-31649*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.

EVALUATION OF A HYBRID HYDROSTATIC BEARING FOR CRYOGENIC TURBOPUMP APPLICATION

Paul W. Spica, Ned P. Hannum, and Scott D. Meyer 1986 19 p

(NASA-TM-87255; E-2945; NAS 1.15:87255) Avail: NTIS HC A02/MF A01 CSCL 13K

A hybrid hydrostatic bearing was designed to operate in liquid hydrogen at speeds to 80,000 rpm and radial loads to 440 n (100 lbf). The bearing assembly consisted of a pair of 20-mm angular-contact ball bearings encased in a journal, which was in turn supported by a fluid film of liquid hydrogen. The size and operating conditions of the bearing were selected to be compatible with the operating requirements of an advanced technology turbopump. Several test parameters were varied to characterize the bearing's steady-state operation. The rotation of the tester shaft was varied between 0 and 80,000 rpm. Bearing inlet fluid pressure was varied between 2.07 and 4.48 MPa (300 and 650 psia), while the fluid sump pressure was independently varied between 0.34 and 2.07 MPa (50 and 300 psia). The maximum radial load applied to the bearing was 440 N (110 lbf). Measured hybrid-hydrostatic-bearing stiffness was 1.5 times greater than predicted, while the fluid flow rate through the bearing was 35 to 65 percent less than predicted. Under two-phase fluid conditions, the stiffness was even greater and the flow rate was less. The optimal pressure ratio for the bearing should be between 0.2 and 0.55 depending on the balance desired between bearing efficiency and stiffness. Startup and shutdown cyclic tests were conducted to demonstrate the ability of the hybrid-hydrostatic-bearing assembly to survive at least a 300-firing-duty cycle. For a typical cycle, the shaft was accelerated to 50,000 rpm in 1.8 sec. The bearing operated for 337 start-stop cycles without failure. Author

PERFORMANCE CHARACTERISTICS OF RING-CUSP THRUSTERS WITH XENON PROPELLANT

Michael J. Patterson 1986 35 p Presented at the 22nd Joint Propulsion Conference, Huntsville, Ala., 16-18 Jun. 1986; sponsored by AIAA, ASME, SAE and ASEE

(NASA-TM-87338; E-3085; NAS 1.15:87338; AIAA-86-1392) Avail: NTIS HC A03/MF A01 CSCL 21H

The performance characteristics and operating envelope of several 30-cm ring-cusp ion thrusters with xenon propellant were investigated. Results indicate a strong performance dependence on the discharge chamber boundary magnetic fields and resultant distribution of electron currents. Significant improvements in discharge performance over J-series divergent-field thrusters were achieved for large throttling ranges, which translate into reduced cathode emission currents and reduced power dissipation which should be of significant benefit for operation at thruster power levels in excess of 10 kW. Mass spectrometry of the ion beam was documented for both the ring-cusp and J-series thrusters with xenon propellant for determination of overall thruster efficiency, and lifetime. Based on the lower centerline values of doubly charged ions in the ion beam and the lower operating discharge voltage, the screen grid erosion rate of the ring-cusp thruster is expected to be lower than the divergent-field J-series thruster by a factor of 2. Author

THE NONCAVITATING PERFORMANCE AND LIFE OF A SMALL VANE-TYPE POSITIVE DISPLACEMENT PUMP IN LIQUID HYDROGEN

Thomas E. Ulbricht and Joseph A. Hemminger 1986 28 p Presented at the 22nd Joint Propulsion Conference, Huntsville, Ala., 16-18 Jun. 1986; sponsored by AIAA, ASME, SAE and ASEE

(NASA-TM-87347; E-3100; NAS 1.15:87347; AIAA-86-1438) Avail: NTIS HC A03/MF A01 CSCL 21H

The low flow rate and high head rise requirements of hydrogen/oxygen auxiliary propulsion systems make the application of centrifugal pumps difficult. Positive displacement pumps are well-suited for these flow conditions, but little is known about their performance and life characteristics in liquid hydrogen. An experimental and analytical investigation was conducted to determine the performance and life characteristics of a vane-type, positive displacement pump. In the experimental part of this effort, mass flow rate and shaft torque were determined as functions of

shaft speed and pump pressure rise. Since liquid hydrogen offers little lubrication in a rubbing situation, pump life is an issue. During the life test, the pump was operated intermittently for 10 hr at the steady-state point of 0.074 lbm/sec (0.03 kg/sec) flow rate, 3000 psid (2.07 MPa) pressure rise, and 8000 rpm (838 rad/sec) shaft speed. Pump performance was monitored during the life test series and the results indicated no loss in performance. Material loss from the vanes was recorded and wear of the other components was documented. In the analytical part of this effort, a comprehensive pump performance analysis computer code, developed in-house, was used to predict pump performance. The results of the experimental investigation are presented and compared with the results of the analysis. Results of the life test are also presented. M.G.

N86-31652*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ANALYSIS OF THE GAS PARTICLE RADIATOR (GPR)
Donald L. Chubb Jul. 1986 35 p
(NASA-TM-88786; E-2639-1; NAS 1.15:88786) Avail: NTIS HC A03/MF A01 CSCL 20D

The theoretical performance of a new space radiator concept, the gas particle radiator (GPR), is calculated. The GPR uses a gas containing emitting, submicron particles as the radiating media. A transparent window contains the gas particle mixture around the solid radiator emitting surface. A major advantage of the GPR is that large emissivity (e sub T is greater than or = 0.8) is achieved without the use of emissive coatings. A radiation heat transfer analysis shows that for a modest volume fraction (approx. 10(-4)) of submicron particles and gas thickness (approx. 1 cm) the emissivity, e sub T, is limited by the window transmittance. Besides determining the emissivity, the window is the critical element for making it possible for the GPR to have lower mass than a tube type radiator. The window acts as a bumper to provide meteoroid protection for the radiator wall. The GPR was compared to a proposed titanium wall, potassium heat pipe radiator. For both radiators operating at a power level of 1.01 MW at 775 K it was calculated that the GPR mass was 31 percent lower than the heat pipe radiator. Author

SOLID ROCKET MOTOR WITH NOZZLE CONTAINING AROMATIC AMIDE FIBERS Patent
Joseph W. Lewis, inventor (to Air Force) Issued 11 Mar. 1986 5 p
(AD-D012250; US-Patent-4,574,700; US-Patent-Appl-SN-671395; US-Patent-Class-102-287) Avail: US Patent and Trademark Office CSCL 21/8

It is an object of the present invention to provide an improved nozzleless solid rocket motor comprising means for reducing erosive burning effects in the nozzle portion. In accordance with the present invention there is provided a solid rocket motor comprising a rocket case having a closed front end and an open second end, and a centrally ported propellant grain comprising a main portion and a nozzle portion, wherein the main portion is a shaped and cured first propellant, wherein the nozzle portion comprises a shaped and cured second propellant composition having a plurality of aromaic polyamide fibers dispersed throughout. DOME RESTRAINT ASSEMBLY FOR ROCKET MOTORS Patent
Peter F. ODriscoll, inventor (to Air Force) 25 Mar. 1986 7 p
Supersedes AD-D011041
(AD-D012278; US-Patent-4,577,542; US-Patent-Appl-SN-586952; US-Patent-Class-86-20D) Avail: US Patent and Trademark Office CSCL 21/8

This invention relates to an adjustable restraint assembly connectable between a dome portion of a solid propellant rocket motor casing and a rigid base or support, for use during the curing of a propellant in the casing. The assembly includes an upper attach bracket connectable to the dome portion, a lower attach bracket connectable to a rigid base, upper and lower brackets, respectively, and an adjustable threaded turn-buckle-like member connected between the flanges. The assembly is used to establish a maximum net downward deflection of the dome portion upon maximum pressurization of the uncured propellant in the motor casing and is thereafter adjusted at various times during the curing process to reduce and ultimately eliminate the deflection in increments to thereby improve the bond between the grains of the cured propellant and the casing in the region of the forward dome. STUDY ON ALGORITHMS FOR PREDICTION OF SOLID PROPELLANT ROCKET MOTOR PERFORMANCE
Xin Wang and Zhongqin Zhang 22 Apr. 1986 15 p Transl. into ENGLISH from Hang Kong Xuebao (China), v. 5, no. 3, Sep. 1984 p 288-295
(AD-A167842; FTD-ID(RS)T-0152-86) Avail: NTIS HC A02/MF A01 CSCL 21/8

This article introduces two predictive algorithms for the performance of solid propellant rocket motor. The emphasis is on the introduction of Time-Space Algorithm. The authors proposed a general two-dimensional grain calculation procedure in order to conduct the grain calculations. Therefore, the predictive algorithms for performance introduced by this article show generality. A comprehensive computer program for the aforementioned method has been written and applied to calculating the performance of three different solid rocket motors. The calculated results are consistent with those derived from experimental data. GRA

THE HIGHLY UNDEREXPANDED EXHAUST PLUME FROM NOZZLES WITH BOUNDARY LAYER
Karl Wieland Naumann Sep. 1985 114 p Original language document was announced as N85-31230
(ESA-TT-929; DFVLR-FB-85-10; ESA-86-97573) Avail: NTIS HC A06/MF A01; original German version available from DFVLR, Cologne, West Germany DM 28

The expansion of underexpanded free jets from a conical hypersonic nozzle is analyzed for Reynolds numbers typical of satellite attitude control thrusters. The laminar nozzle boundary

layer is measured. Streamlines in the free jet and the flow conditions inside the barrel shock are determined. Comparison with the Simons continuum plume model shows discrepancies proceeding from rarefaction effects in the Prandtl-Meyer expansion originating at the nozzle lip (freezing of the expansion curvature). The suitable formulation of a freezing parameter allows the fixing of the frozen streamline directions and flow conditions in the free jet expansion even for the streamlines originating from the nozzle boundary layer. Approximated free jet configurations show good agreement with experiments. ESA

The chemistry of compounds containing silicon-silicon double bonds was investigated. Two new disilenes were synthesized and rotational barriers to cis-trans interconversion were determined to be 25-31 Kcal/mol. Oxidation of disilenes led to the 1,3-cyclodisiloxanes, as well as to disilene epoxide and 1,2-dioxetanes, all novel structures. Many new polysilane high polymers were synthesized, and their photoactivity was investigated. Several new methods for crosslinking of polysilanes were developed, and the first polysilanes containing functional side groups were prepared. Several cyclosilane families of compounds were also investigated. GRA

Avail: Issuing Activity

Cure cycles in autoclave molding of CFRP are discussed. Partial-cure, dwell-time, dual vacuum, and dual pressure were examined. Their significance to laminate quality is explained. It is argued that the packing of the fibers is determined by processes other than, and remote from, the autoclave. Thus the final thickness and fiber volume fraction are not under the autoclave operator's control. The cure cycle must be tuned to give, not a specific thickness, but that thickness which is inherent in the prepreg laminae used. The common factor behind all these phenomena is shown to be the relationship of viscosity to gel time in that resin can flow only until gelation effectively stops all flow. ESA

FIBER COMPOSITE SANDWICH THERMOSTRUCTURAL BEHAVIOR: COMPUTATIONAL SIMULATION
C. C. Chamis, R. A. Aiello, and P. L. N. Murthy (Cleveland State Univ., Ohio) 1986 18 p Presented at the 27th Structures, Structural Dynamics and Materials Conference (SDM), San Antonio, Tex., 19-21 May 1986; sponsored by AIAA, ASME, ASCE and AHS
(NASA-TM-88787; E-3112; NAS 1.15:88787) Avail: NTIS HC A02/MF A01 CSCL 11D

Several computational levels of progressive sophistication/simplification are described to computationally simulate composite sandwich hygral, thermal, and structural behavior. The computational levels of sophistication include: (1) three-dimensional detailed finite element modeling of the honeycomb, the adhesive and the composite faces; (2) three-dimensional finite element modeling of the honeycomb assumed to be an equivalent continuous, homogeneous medium, the adhesive and the composite faces; (3) laminate theory simulation where the honeycomb (metal or composite) is assumed to consist of plies with equivalent properties; and (4) derivations of approximate, simplified equations for thermal and mechanical properties by simulating the honeycomb as an equivalent homogeneous medium. The approximate equations are combined with composite hygrothermomechanical and laminate theories to provide a simple and effective computational procedure for simulating the thermomechanical/thermostructural behavior of fiber composite sandwich structures. The Integrated Composites ANalyzer (ICAN), a stand-alone computer code, incorporates micromechanics equations and laminate theory to analyze/design multilayered fiber composite structures. Procedures for both the implementation of new data in ICAN and the selection of appropriate measured data are summarized for: (1) composite systems subject to severe thermal environments; (2) woven fabric/cloth composites; and (3) the selection of new composite systems including those made from high strain-to-fracture fibers. The comparisons demonstrate the versatility of ICAN as a reliable method for determining composite properties suitable for preliminary design. M.G.

Overall emphasis is on basic long-term research in the following categories: constituent materials, composite materials, generic structural elements, processing science technology; and maintaining long-term structural integrity. Research in basic composition, characteristics, and processing science of composite materials and their constituents is balanced against the mechanics, conceptual design, fabrication, and testing of generic structural elements typical of aerospace vehicles so as to encourage the discovery of unusual solutions to present and future problems. Detailed descriptions of the progress achieved in the various component parts of this comprehensive program are presented. B.G.

TEMPERATURE DEPENDENT NONLINEAR METAL MATRIX LAMINAE BEHAVIOR Final Technical Report, Dec. 1984 - Nov. 1985
David J. Barrett and Kent W. Buesking Washington NASA Sep. 1986 123 p
(NAS1-17822)
(NASA-CR-4016; NAS 1.26:4016; MSC-TFR-1607/0211) Avail: NTIS HC A06/MF A01 CSCL 11D

An analytical method is described for computing the nonlinear thermal and mechanical response of laminated plates. The material model focuses upon the behavior of metal matrix materials by relating the nonlinear composite response to plasticity effects in the matrix. The foundation of the analysis is the unidirectional material model which is used to compute the instantaneous properties of the lamina based upon the properties of the fibers and matrix. The unidirectional model assumes that the fibers properties are constant with temperature and assumes that the matrix can be modelled as a temperature dependent, bilinear, kinematically hardening material. An incremental approach is used to compute average stresses in the fibers and matrix caused by arbitrary mechanical and thermal loads. The layer model is incorporated in an incremental laminated plate theory to compute the nonlinear response of laminated metal matrix composites of general orientation and stacking sequence. The report includes comparisons of the method with other analytical approaches and compares theoretical calculations with measured experimental material behavior. A section is included which describes the limitations of the material model. M.G.

DAMPING CHARACTERISTICS OF METAL MATRIX COMPOSITES Quarterly Letter Report
10 Apr. 1986 6 p
(Contract N00014-85-C-0857)
(AD-A167792; MCR-85-721) Avail: NTIS HC A02/MF A01 CSCL 11/4

Damping test data of Gr/Al composites, from previous measurements at Martin Marietta Denver Aerospace, CO suggest that composites exhibit higher damping than aluminum and titanium base structural alloys. Enhanced material damping of metal matrix composite (MMC), as a structural material will significantly improve the stability control and reliability of space structures. The objectives of the present investigation are: (1) to identify the mechanism and the source of damping in MMC (P55 Gr/6061 Al); (2) to determine the role of microstructural parameters, e.g., fiber volume, fiber orientation and interfiber spacing, and (3) to define the role of fiber matrix interfaces. DAMAGE ASSESSMENT BY ACOUSTO-ULTRASONIC TECHNIQUES IN COMPOSITES
Luis Lorenzo and H. T. Hahn Apr. 1986 41 p
(Contract N00014-85-K-0795)
(AD-A168097; WU/CCR-86/2) Avail: NTIS HC A03/MF A01 CSCL 11/7

This paper addresses the non-destructive evaluation of cross-ply 0/90 subscript 2S and 90/0 subscript 25 S-2 G1/DER 332 laminates using acousto-ultrasonic and acoustic emission techniques. Acoustic emission and acousto-ultrasonic measurements gave early warnings of damage initiation before transverse cracks became visible. AU parameters such as peak amplitude, energy and stress wave factor were equally sensitive to damage initiation but peak amplitude and energy were more sensitive to damage accumulation. Variations of peak amplitude, event duration, ringdown counts, and rise time in AU tests were analyzed to show that internal damage not only increased the apparent attenuation but also affected the wave envelope. The same effect was also present in AE tests. Acousto-ultrasonic tests of an undamaged cross-ply laminate showed that the apparent attenuation coefficients were almost independent of the wave propagation direction. The strongest wave was found along the fibers in the ply in contact with the transducers and the weakest wave traveled at an angle of 45 deg to the fibers. GRA

(Contract W-7405-eng-48)
(DE86-008787; UCID-20691) Avail: NTIS HC A02/MF A01

This document is comprised of two papers: mechanics of fiber composites; and manufacturing and processing (of metals, ceramics, polymers). In the first, life predictions based on damage kinetics for various types of composite material combinations are studied. Structural optimization using the inherent anisotropy of composites offers potential rewards of increased performance. In the second, manufacturing and materials processing provide a wide spectrum of mechanics related problems. The reduction in defects ultimately relates to controlled processes which in turn come from realistic modelling of the physical events. New methods to produce lightweight materials with carefully controlled microstructure is studied. E.R.

(Contract DE-AC04-76DR-00789)
(DE86-011913; SAND-86-8221) Avail: NTIS HC A03/MF A01

A current Sandia project responsibility involves the design and construction of a structure requiring high stiffness to weight ratio and extreme thermal stability. To meet these requirements, a baseline design proposes a sandwich type construction with facesheets composed of Pitch 75/ 3501-6 graphite/epoxy composite material. We have performed experiments to quantify the in-plane stiffness characteristics of this material. These tests are essential for two reasons. First, the results are to be input into a structural computer code to perform numerical simulations of component performance. Second, it is essential to verify that the fabricated product meets the specifications claimed by the vendor: this is especially important for composite materials because the final product depends strongly upon raw material condition as well as the layup and autoclaving procedures. Finally, we report preliminary attempts at measuring the in-plane thermal expansion coefficients of the composite plates using strain gages. DOE

DEVELOPMENT AND APPLICATION OF ENERGY ABSORBING COMPOSITE DEVICES IN CRASH-WORTHY STRUCTURES
J. K. Wells 1985 20 p
(ESA-86-97253) Avail: NTIS HC A02/MF A01

By careful control of fiber, resin, and geometrical parameters, structural composite sections which collapse in a progressive manner, absorbing a large amount of energy, were developed. Energy absorption per unit weight is between 5 and 10 times that of metallic structures. A wide variety of fibers, resins and constructions were tested at speeds between quasi-static and 17 m/sec (40 mph). The variability of the sustained load during collapse and the control of break-out load are discussed. Applications of the technology for automotive and aerospace uses are discussed. The devices are shown to offer a very low weight solution to energy absorption problems. ESA

PHASE-SENSITIVE a.c. POLAROGRAPHY AND ITS DATA PROCESSING BY MICROCOMPUTER-CONTROLLED ELECTROANALYTICAL SYSTEM
T. Wasa (Osaka Perfecture, Japan), K. Akimoto, and H. Yamamoto Dec. 1985 13 p Transl. into ENGLISH from Bunseki Kagaku (Japan). v. 33, no. 8, 1984 p T69-T72
(DRIC-T-7634; BR98337; ESA-86-97262) Avail: Issuing Activity

A phase-sensitive ac polarograph and its automatic data-processing system were constructed through incorporation of a small-amplitude ac voltage source, an IR-drop compensator, and a lock-in amplifier into a microcomputer-controlled, electroanalytical system. System control and data-processing programs are the same as those of differential pulse polarography. System performance and applicability are evaluated through comparison of results obtained by computer data processing and manual treatment. The overall precision of the system for determination of depolarizers [Pb (II), Cd (II), Zn (III), pyrazinamide, etc.] in the range 0.02 nM to 0.5 nM is within 2% for peak current, 1% for peak potential, and 2% for half-peak width. Data-processing time is 1 to 3 min/peak. Characteristics of the fitting functions, such as Gaussian, Lorenzian, and theoretical equations are investigated. ESA

A MATHEMATICAL APPROACH FOR EVALUATING NICKEL-HYDROGEN CELLS
Harold F. Leibecki 1986 18 p Proposed for presentation at the 1986 Fall Annual Meeting of the AIChE, Miami, Fla., 2-7 Nov. 1986
(NASA-TM-88803; E-3114; NAS 1.15:88803) Avail: NTIS HC A02/MF A01 CSCL 10C

A mathematical equation is presented which gives a quantitative relationship between time-voltage discharge curves, when a cell's ampere-hour capacity is determined at a constant discharge current. In particular the equation quantifies the initial exponential voltage decay; the rate of voltage decay; the overall voltage shift of the curve and the total capacity of the cell at the given discharge current. The results of 12 nickel-hydrogen boiler plate cells cycled to 80 percent depth-of-discharge (DOD) are discussed in association with these equations. Author

COHERENT STRUCTURES IN TURBULENT SHEAR LAYERS AND RELATION TO MIXING REACTION AND COMBUSTION Final Report
Apr. 1986 8 p
(Contract N00014-80-C-0694)
(AD-A167042) Avail: NTIS HC A02/MF A01 CSCL 20/4

A number of numerical analyses served as experiments which led to a broad range of ideas about the dynamics of mixing layer. One theme which emerged early was the adversary role of vorticity and of deformation - two quantities which attempt to subjugate each other and whose competition is the subject matter of the development and growth to the shear flow. Another strand of the work follows a number of instabilities (two and three dimensional) which lead to recognizable non-linear motions. A third focus of the work relates vorticity and the mixing of scalars. The work started out to attempt to explain striking experimental results and ended by making a number of predictions which have not yet been experimentally established. A significant fraction, though not all of the typical motions which are dynamically plausible in a shear layer have been examined and given simple analytic representation. Finally the basis for the effective control of the shear layer has been laid. GRA

IN-SITU SOLID-PROPELLANT BURN-RATE MEASUREMENTS USING FLASH CINERADIOGRAPHY Final Report, 1 Oct. 1983 - 30 Sep. 1984
R. Y. Walker, R. A. Gamble, and L. M. Smith (Tennessee Univ. Space Inst., Tullahoma) Apr. 1986 45 p Prepared in cooperation with AEDC
(AD-A167637; AEDC-TR-85-22) Avail: NTIS HC A03/MF A01 CSCL 21/8

Flash radiography has been applied to the measurement of solid-propellant burn rates during a series of solid-propellant rocket motor tests at AEDC. This technique offers the advantage of realistic operating conditions and higher data rates than other measurement techniques. The propellant grains were cylindrically perforated and had action times ranging from 2.2 to 3 sec. Four of the six motors were designed to exhibit varying degrees of erosive burning. Chamber pressure and axial thrust were measured on each of the tests. Approximately 25 radiographs (at a rate of 6 per second) were recorded during the tests. These radiographs were subjected to three different methods of image processing. In addition to the quantitative data obtained, many interesting burn anomalies were revealed in the radiographs. GRA

The Workshop on the Frontiers of Theoretical and Experimental Electrochemistry was held at the Los Alamos National Laboratory, February 25 to 26, 1985, to identify those problems and techniques that are at the forefront of electrochemistry research and to generate a summary that will be a guide to the most fruitful areas of electrochemistry research and a foundation for long-term support of such work in this country. Among the conclusions, major advances in understanding electrochemical systems are expected from the application of the new tools for in situ characterization of the solid/electrolyte interface. Parallel thrusts are needed in the areas of theory, experiments on well-defined surfaces, and exploratory research on new interfacial phenomena and new electrode materials. Several specific areas for new research are described in this report. DOE

RAMAN SPECTRA OF RINGS IN SILICATE MATERIAL
D. R. Tallant, B. C. Bunker, C. J. Brinker, and C. A. Balfe 1986 7 p Presented at the Materials Research Society Spring Meeting, Palo Alto, Calif., 15 Apr. 1986
(Contract DE-AC04-76DP-00789)

(DE86-009629; SAND-85-2447C; CONF-860445-6) Avail: NTIS HC A02/MF A01

Raman spectroscopic studies on gel-derived silicates have confirmed that narrow bands near 607 cm-1 and 492 cm-1, first observed in the Raman spectrum of fused silica, are associated with three- and four-fold siloxane rings. Using these results, we have identified three- and four-fold siloxane rings in other high-surface-area silica materials, including leached glasses and Cab-O-Sil. This Raman spectroscopic evidence not only shows that small siloxane rings are a common characteristic of a number of silica materials but also suggests that they form preferentially at silica surfaces. This paper reviews the Raman spectroscopic evidence that led to the identification of the vibrational frequencies of the small siloxane rings and presents the results of Raman experiments on high-surface-area silica materials in which the concentration of small siloxane rings is enhanced compared to fused silica. THEORETICAL STUDIES OF COMBUSTION DYNAMICS Final Technical Report
J. M. Bowman 1986 4 p
(Contract DE-AC02-81ER-10900)
(DE86-009312; DOE/ER-10900/T3) Avail: NTIS HC A02/MF A01

We developed a novel quantum theory of reactive scattering in which two degrees of freedom are explicitly coupled together and the remaining degrees of freedom are treated in several approximate ways. These approximations have the effect of uncoupling the remaining degrees of freedom from the two which are coupled. Thus, explicit coupling is retained in a reduced dimensionality space. Applications of this theory are discussed and the results are reviewed. A vibrational analysis of polyatomic molecules is included. DOE

INTERMITTENCY AND CONDITIONAL VELOCITIES IN PRE-MIXED CONICAL TURBULENT FLAMES
R. K. Chang and I. G. Shepherd Apr. 1986 20 p Presented at the Spring Meeting of the Western States Section of the Combustion Institute, Alberta, Canada, 28 Apr. 1986 Prepared in cooperation with California Univ., Berkeley
(Contract DE-AC03-76SF-00098)
(DE86-009363; LBL-21299; CONF-8604144-3) Avail: NTIS HC A02/MF A01

A turbulent premixed ethylene/air conical flame in a large Bunsen type burner has been studied using a two-component laser Doppler anemometry (LDA) system. Conditioned reactant velocity statistics were measured using a silicon oil aerosol, which evaporated and burned through the flame fronts, as the LDA seed. The intermittency was also determined by monitoring the Mie scattering intensity from the aerosol. The unconditioned velocity statistics were measured using aluminum oxide particles. A conditional analysis method was developed to deduce the conditioned product velocities. The method is based on deconvolution of the velocity probability density function (pdf). The difference between the conditioned mean product velocity and the conditioned mean reactant velocity, (DELTA)U, within the oblique region of the Bunsen flame is less than that observed previously in v-shaped premixed turbulent flames. The main reason is that combustion induced flow acceleration is lower for the lean test mixture. The conditioned product rms velocities are almost equal to the conditioned reactant rms velocities meaning that flame generated turbulence is not significant. The unconditioned and conditioned covariance (Reynolds stress) are negligibly small through the flame. Since the flame brush is almost parallel to the burner axis, this result is consistent with the covariances for the v-flames after the data was transformed with respect to the flame co-ordinate. DOE

ROLE OF THE RADICAL POOL IN COMBUSTION
J. R. Creighton and A. K. Oppenheim 1985 11 p Presented at the 10th International Colloquium on Dynamics of Explosions and Reactive Systems, Berkeley, Calif., 4 Aug. 1985 Prepared in cooperation with California Univ., Berkeley
(Contract W-7405-eng-48)
(DE86-010159; UCRL-91994; CONF-850830-8) Avail: NTIS HC A02/MF A01

We present numerical solutions of the detailed chemical kinetics mechanisms for the reactions of hydrogen with fluorine and oxygen on a phase plane where temperature is plotted vs the concentration of one of the radicals, F or H. We observe that for given initial reactant concentrations, all solutions follow a common path, after an initial transient, regardless of initial temperature of initial radical concentration. We then analyze the reaction mechanism and fine that the rate equations for radical species rapidly reach a stable steady state that couples all of the radicals into a pool. The pool concentration then grow until onset of a reaction that consumes two radicals, resulting in a steady state of the entire pool. Further growth of the pool is due entirely to the temperature dependence of the steady state, which has the form of an equilibrium constant. We show that the rate of temperature increase is proportional to the radical pool concentration, particularly its steady-state value. DOE

AMBIENT TEMPERATURE LIQUEFACTION USING LIQUID CLATHRATES Quarterly Report, 15 Jan. - 14 Apr. 1986
J. L. Atwood 1986 7 p
(Contract DE-FG22-85PC-80912)
(DE86-010361; DOE/PC-80912/T2; QR-2) Avail: NTIS HC A02/MF A01

One of the more significant advances during the last quarter were observations which lead to an enhanced understanding of the basic liquid clathrate itself. This is a particularly relevant point because there is significant agreement that we can never reach full utility for liquid clathrates in coal liquefaction until we fully understand the liquid clathrate effect. It is well known that liquid clathrates form with a variety of aromatic solvents. Early on we attempted to make a liquid clathrate with 1-methylnaphthalene. This was a desirable choice because of the presence of the aromatic rings which seem to mimic some of the products found in work-ups of more classic coal liquefaction experiments. However, to our surprise 1-methylnaphthalene reacts with liquid clathrate-forming salts to yield a pure one-phase solution. In the course of a detailed examination of this phenomenon, we carried out experiments with 1-methylnaphthalene/toluene mixtures. A variety of different concentrations were utilized. The ones of greatest importance are 20% toluene, 80% 1-methylnaphthalene, 50-50, and 80-20. All of these form liquid clathrates. The ones which have the most toluene form liquid clathrates at room temperature. The one with the least toluene forms a liquid clathrate only at low temperature. For each concentration in the range given above there is a critical change from one phase to two phase behavior with temperature. DOE

AROMATICS OXIDATION AND SOOT FORMATION IN FLAMES Progress Report, year beginning 15 Aug. 1985
J. B. Howard 1986 5 p
(Contract DE-FG02-84ER-13282)
(DE86-010585; DOE/ER-13282/2) Avail: NTIS HC A02/MF A01

Kinetics and mechanisms of aromatics oxidation and soot formation in flames are being studied by measuring profiles of soot particle size and number concentration, stable and radical gaseous species concentrations, and temperature in premixed flat flames at 2.67 kPa. Net reaction rates calculated from these measurements are used to test mechanisms of soot formation and oxidation of aromatic species. The technique for measuring radical species is molecular-beam sampling with on-line mass spectrometry, which also provides stable species data. The latter are supplemented by the data from microprobe sampling, and optical methods are being considered for supplementing the H-atom and/or OH-radical measurements. In order to utilize extensive data from previous and current molecular beam mass

spectrometry research in this laboratory, the experimental conditions are chosen to match those of the other work. DOE

DEGRADATION OF MATERIALS IN COMBUSTION ENVIRONMENTS
J. I. Federer, J. M. Robbins, W. P. Parks, Jr., and J. S. Reid 1986 8 p Presented at the 6th Annual Energy Technology Conference, Houston, Tex., 17 Jun. 1986 Prepared in cooperation with Babcock and Wilcox Co., Lynchburg, Va.
(Contract DE-AC05-84OR-21400)
(DE86-011771; CONF-860607-1) Avail: NTIS HC A02/MF A01

Degradation mechanisms in conventional refractories, structural ceramics, and metallic alloys were revealed by examination of materials exposed to industrial and synthetic flue gases. Deterioration of refractory oxides and oxide structural ceramics involved formation of new liquid, glass, and solid phases, which resulted in loss of structural integrity. Destructive stresses associated with volume changes in the case of new solid phases were sometimes increased by thermal cycling. In the case of silicon carbide ceramics the viscosity of the normally protective oxide film was lowered by reaction with alkali oxides, which resulted in enhanced oxygen diffusion and active oxidation. Silicon carbide was also attacked by halide-containing atmospheres. Degradation was also caused by excessive temperatures, thermal cycling, and stresses caused by adhering slags. Several types of degradation mechanisms were observed in metallic alloys including breakaway oxidation, intergranular oxidation and attack, and sulfidation-oxidation. DOE

A NEW WAY OF ORGANIZING SPECTRAL LINE RATIO FLUCTUATIONS
Bo Thelin Oct. 1985 17 p
(KGI-Preprint-084; ISSN-0349-2656; ESA-86-97223) Avail: NTIS HC A02/MF A01

An analysis method of organizing spectral line ratio fluctuations was developed to see which line pair of analysis is more or less stable at repeated measurements. A linear graph is obtained for iron lines when the spectral line ratio fluctuations were plotted versus the photon energies of these lines. When these fluctuations were plotted versus the upper energies instead, no linear structure is obtained. This means that there is no linearity with the conventional intensity formula with the Boltzmann exponent, but there is if exp (-h nu sub mn/kT) is used. The same result is achieved on absolute intensities of iron lines using intensity tables from direct current arc measurements with photographic registration. ESA

MOISTURE MEASUREMENT IN SOLIDS Final Report, Jan. 1985
Walter Borst, Rainer Herrmann, Rainer Silbermann, and Dieter Trefzer Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 71 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-174; ISSN-0340-7608; ESA-86-97446) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 15

A system using the damping of microwave radiation was developed for the measurement of the moisture content of solids in industrial applications. For the microwave part a compensating principle was selected, and the circuit was optimized with respect to sensitivity, high dynamic range, and temperature stability. Algorithms for the moisture content dependence on the damping factor were derived; they take into account temperature and density of the material as well as standing wave effects of the microwave arrangement. In laboratory tests with prototypes the algorithms were confirmed, and the influence of disturbances was successfully compensated. ESA

REMOTE GAS ANALYSIS WITH LASERS. ANALYTIC LABORATORY INVESTIGATIONS IN THE 3.4 TO 4.2 MICRONS RANGE Final Report, Jul. 1980
Joerg Boscher and Wolfgang Diehl Bonn, West Germany Bundesministerium fuer Forschung und Technologie Dec. 1985 186 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-020; ISSN-0170-1339; ESA-86-97464) Avail: NTIS HC A09/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 35

The absorption spectra of methane, ethane, propane, isobutane, n-butane, proprene 1, 1-butene, methyl chloride and hydrogen chloride were measured with lead salt diode laser spectrometers with respect to wavelength, pressure, and temperature. The measurements were analyzed to evaluate the accuracy and the applications of the spectrometer. Doppler-propagated spectra at low pressures in pure gases and shock-propagated spectra in mixed gases with synthetic air at variable pressures were measured. The spectra are classified by spectral line density, individual line force and width. The gases are classified into three groups according to their spectral structure. The value of the absorption factor determines the applicability of differential absorption spectrometry. The high resolution diode laser spectrometer should be used to measure individual line structure only. ESA

MODEL FOR NORMAL AND EROSIVE BURNING OF COMPOSITE PROPELLANTS
Jean-Claude Godon Dec. 1985 186 p Original language document was announced as N85-24024
(ESA-TT-910; ONERA-NT-1984-3; ESA-86-97798) Avail: NTIS HC A09/MF A01

Processes governing the normal combustion of composite propellants, and the causes of the erosive burning phenomenon are discussed. Analytical expression of the combustion mechanisms leads to the construction of numerical models describing the autonomous combustion of ammonium perchlorate and the normal combustion of composite propellants. A first coupling with a calculation for a turbulent boundary layer with wall injection gives an evaluation of the intensification of combustion in erosive conditions, due to the existence of a high specific mass flow rate sweeping the surface. Each model is based on experimental data or data from the literature. Results show good agreement with experimental data. ESA

CHARACTERIZATION OF CELLULOSE NITRATE WITH LIQUID CHROMATOGRAPHY AND MEMBRANE OSMOMETRY
Anders Wirsen and Eyvind Helleday Feb. 1986 35 p In SWEDISH; ENGLISH summary
(FOA-C-20602-D1; ISSN-0347-3694; ESA-86-97858) Avail: NTIS HC A03/MF A01

Cellulose nitrate (CN) of varying molecular weight, nitration, and molecular weight distribution was studied. The average molecular weights were determined on line with a low angle laser detector (LALLS) and the degree of nitration with an infrared detector, both in combination with a concentration detector

(differential refractometer). The molecular weight data were in good agreement with static LALLS and membrane osmometry on unfractioned samples. Qualitative correlation with viscosimetry was observed. The degree of nitration was accurately determined for pure CN as well as for CN in propellants. ESA

STUDY ON EFFECTS OF POWDER AND FLAKE CHEMISTRY AND MORPHOLOGY ON THE PROPERTIES OF Al-Cu-Mg-X-X-X POWDER METALLURGY ADVANCED ALUMINUM ALLOYS Final Report
P. J. Meschter, R. J. Lederich, and J. E. ONeal Aug. 1986 74 p (Contract NAS1-17107)
(NASA-CR-178145; NAS 1.26:178145) Avail: NTIS HC A04/MF A01 CSCL 11F

A study was conducted: (1) to develop rapid solidification processed (RSP) dispersoid-containing Al-3Cu-2Li-1Mg-0.2Zr alloys as substitutes for titanium alloys and commercial 2XXX aluminum alloys for service to at least 150 C; and (2) to develop RSP Al-4Li-Cu-Mg-Zr alloys as substitutes for high-strength commercial 7XXX alloys in ambient-temperature applications. RSP Al-3Cu-2Li-1Mg-0.2Zr alloys have density-normalized yield stresses at 150 C up to 52% larger than that of 2124-T851 and up to 30% larger than that of Ti-6Al-4V. Strength at 150 C in these alloys is provided by thermally stable delta' (Al_3Li), T1 (Al_2LiCu), and S' (Al_2CuMg) precipitates. Density-normalized yield stresses of RSP Al-3Cu-2Li-1Mg-0.2Zr alloys are up to 100% larger than that of 2124-T851 and equivalent to that of Al-8Fe-4Ce at 260 C. Strength in the RSP alloys at 260 C is provided by incoherent dispersoids and subboundary constituent particles such as T1 and S. The RSP alloys are attractive substitutes in less than or = 100-h exposures for 2xxx and Al-4Fe-Ce alloys up to 260 C and for titanium alloys up to 150 C. RSP Al-4Li-Cu-Mg-Zr alloys have ambient-temperature yield and ultimate tensile stresses similar to that of 7050-T7651, and are 14% less dense. RSP Al-4Li-0.5Cu-1.5Mg-0.2Zr has a 20% higher specific yield stress, 40% higher specific elastic modulus, and superior corrosion resistance compared to the properties of 7050-T7651. Strength in the Al-4Li-Cu-Mg-Zr alloy class is primarily provided by the substructure and delta' precipitates and is independent of Cu:Mg ratio. Improvements in fracture toughness and transverse-orientation properties in both alloy classes depend on improved melt practices to eliminate oxide inclusions which are incorporated into the consolidated forms. THE LOW CYCLE FATIGUE BEHAVIOR OF A PLASMA-SPRAYED COATING MATERIAL
John Gayda, Timothy P. Gabb, and Robert V. Miner, Jr. 1986 17 p Presented at the 1986 TMS-AIME Annual Meeting, New Orleans, La., 2-6 Mar. 1986
(NASA-TM-87318; E-3050; NAS 1.15:87318) Avail: NTIS HC A02/MF A01 CSCL 11F

Single crystal nickel-base superalloys employed in turbine blade applications are often used with a plasma spray coating for oxidation and hot corrosion resistance. These coatings may also affect fatigue life of the superalloy substrate. As part of a large program to understand the fatigue behavior of coated single crystals, fully reversed, total strain controlled fatigue tests were run on a free standing NiCoCrAlY coating alloy, PWA 276, at 0.1 Hz. Fatigue tests were conducted at 650 C, where the NiCoCrAlY alloy has modest ductility, and at 1050 C, where it is extremely ductile, showing tensile elongation in excess of 100 percent. At the lower test temperature, deformation induced disordering softened the NiCoCrAlY alloy, while at the higher test temperature cyclic hardening was observed which was linked to gradual coarsening of the two phase microstructure. Fatigue life of the NiCoCrAlY alloy was significantly longer at the higher temperature. Further, the life of the NiCoCrAlY alloy exceeds that of coated, /001/-oriented PWA 1480 single crystals at 1050 C, but at 650 C the life of the coated crystal is greater than that of the NiCoCrAlY alloy on a total strain basis. MICROSTRUCTURE-PROPERTY RELATIONSHIPS IN DIRECTIONALLY SOLIDIFIED SINGLE CRYSTAL NICKEL-BASE SUPERALLOYS
Rebecca A. MacKay and Michael V. Nathal 1986 37 p Presented at MiCon 1986: Optimization of Processing, Properties and Service Performance through Microstructural Control, Philadelphia, Pa., 15-16 May 1986; sponsored by ASTM
(NASA-TM-88788; E-3122; NAS 1.15:88788) Avail: NTIS HC A03/MF A01 CSCL 11F

Some of the microstructural features which influence the creep properties of directionally solidified and single crystal nickel-base superalloys are discussed. Gamma precipitate size and morphology, gamma-gamma lattice mismatch, phase instability, alloy composition, and processing variations are among the factors considered. Recent experimental results are reviewed and related to the operative deformation mechanisms and to the corresponding mechanical properties. Special emphasis is placed on the creep behavior of single crystal superalloys at high temperatures, where directional gamma coarsening is prominent, and at lower temperatures, where gamma coarsening rates are significantly reduced. It can be seen that very subtle changes in microstructural features can have profound effects on the subsequent properties of these materials. M.G.

THE CONTINUING BATTLE AGAINST DEFECTS IN NICKEL-BASE SUPERALLOYS
Robert L. Dreshfield 1986 27 p Presented at the 115th TMS Annual Meeting, New Orleans, La., 2-6 Mar. 1986; sponsored by AIME
(NASA-TM-87343; E-3092; NAS 1.15:87343) Avail: NTIS HC A03/MF A01 CSCL 11F

In the six decades since the identification of age hardenable nickel-base superalloys their compositions and microstructures have changed markedly. Current alloys are tailored for specific applications. Thus their microstructures are defined for that application. This paper briefly reviews the evolution of superalloy microstructures and comments on the appearance and implications of microstructural defects in high performance superalloys. It is seen that new alloys and processes have generated new types of defects. Thus as the industry continues to develop new alloys and processes it must remain vigilant toward the identification and control of new types of defects. Author

THE EFFECT OF VARIATIONS OF COBALT CONTENT ON THE CYCLIC OXIDATION RESISTANCE OF SELECTED NI-BASE

SUPERALLOYS
Charles A. Barrett Mar. 1986 24 p Presented at the Annual Meeting of the Metallurgical Society of the American Inst. of Mining, Metallurgical, and Petroleum Engineers, New Orleans, La., 2-6 Mar. 1986
(NASA-TM-87297; E-2952; NAS 1.15:87297) Avail: NTIS HC A02/MF A01 CSCL 11F

Cobalt levels were systematically varied in the Ni-base turbine alloys U-700 (cast), U-700m(PM/HIP), Waspaloy, Mar-M-247, In-738, Nimonic-115, U-720, and SX-R-150. The cobalt levels ranged from 0 wt % to the nominal commercial content in each alloy. The alloys were tested in cyclic oxidation in static air at 1000, 1100 and 1150 C for 500, 200 and 100 hr respectively. An oxidation attack parameter, Ka derived from the specific weight change versus time data was used to evaluate the oxidation behavior of the alloys along with X-ray diffraction analysis of the surface oxides. The alloys tend to form either Cr2O3/chromite spinel or Al2O3/aluminate spinel depending on the CR/Al ratio in the alloys. Alloys with a ratio of 3.5 or higher tend to favor the Cr oxides while those under 3.0 form mostly Al oxides. In general the Al2O3/aluminate spinel forming alloys have the better oxidation resistance. Increased cobalt content lowers the scaling resistance of the higher Cr alloys while a 5.0 wt % Co content is optimum for the Al controlling alloys. The refractory metals, particularly Ta, appear beneficial to both types of oxides perhaps due to the formation of the omni-present trirutile Ni(Ta,Cb,Mo,W)2O6. Both scales break down as increasing amounts of NiO is formed.

MECHANICAL PROPERTY DEVELOPMENT IN HOT ISOSTATIC PRESSED (HIP) LOW ALLOY STEEL POWDER Final Technical Report
Peter Thornton, John Senick, and John Atchinson Jan. 1986 25 p
(AD-A168666; AD-E440318; ARCCB-TR-86005) Avail: NTIS HC A02/MF A01 CSCL 11/6

The mechanical properties of a low alloy steel gas atomized powder, which was hot isostatically pressed (Hipped) to full density, were developed using typical commercial heat treatment practices. Tempering temperatures were varied systematically from 1000 F to 1200 F and the tensile and impact properties evaluated along with the corresponding microstructural conditions. Yield strengths on the order of 180,000 psi accompanied by low temperature, impact toughness values of 18-20 ft-lb were developed in billets of this material, 4 inches in diameter. The results of this study demonstrate that hot isostatic pressing of low alloy steel powder can be utilized to produce high quality components for critical applications which will benefit from near-net shape manufacturing techniques. THE INFLUENCE OF INCUBATION TIME ON THE PASSIVE FILM BREAKDOWN OF ALUMINUM ALLOYS IN SEAWATER
Denise M. Aylor and Patrick J. Moran Apr. 1986 22 p
(AD-A167398; DTNSRDC/SME-86-11) Avail: NTIS HC A02/MF A01 CSCL 11/6

Potential-controlled electrochemical methods were used to characterize the pitting behavior of 6061 alloy aluminum in synthetic ocean water. Irreproducible breakdown potentials (E sub bd) and reproducible repassivation potentials (E sub rp) were determined from cyclic anodic polarization (CAP). Reproducible breakdown and repassivation potentials were found from the quasi-stationary anodic polarization method; however, the breakdown potential values were shifted in the electronegative direction relative to the CAP method due to the allowance of a longer incubation time. These results support the theory that with sufficient incubation time, pit initiation and propagation will occur at potentials at or slightly above the repassivation potential, and that the repassivation potential value is the only characteristic potential for aluminum. The quasi-stationary anodic polarization method used for E sub rp determination provides a reproducible electrochemical method for obtaining E sub rp after minimal pit growth or surface damage. Cyclic anodic polarization can also be used for determining a representative potential if surface damage subsequent to pit initiation is minimized. GRA

(Contract N00014-85-K-0427)
(AD-A167404; TR-4) Avail: NTIS HC A02/MF A01 CSCL 11/6

Progress is reviewed for a research program whose primary purpose is to establish a fundamental understanding of the applications and consequences of selected advanced processing techniques to high performance alloys. The broadly-ranged research effort includes studies of powder processing (hot isostatic pressing), fracture of alloys containing processing-induced defects (porosity), and application of advanced processing techniques to high performance alloys (rapidly solidified, dispersion-strengthened titanium alloys). Many aspects of the program also constitute fundamental studies of deformation and fracture utilizing engineering alloys containing processing-induced defects. Progress for the period October 1, 1985 to December 31, 1985 is reviewed for the following parts of the research program: the influence of void/pore distributions on fracture, hot isostatic pressing of metallic powders, deformation of rapidly solidified Ti alloys at elevated temperatures, and strain-path effects and the combined influence of stress state and grain size on the fracture of alloys containing hydrides. Nickel can be substituted into Fe5C2 to the extent of 20 atomic percent. Samples were prepared by codecomposition of mixed nitrates followed by reduction at 290 C in a 9:1 H2:CO atmosphere. Confirmation of the limit of substitution was made by both magnetic and X-ray analysis. It has been shown by a number of investigators that the catalytic activity of iron catalysts, used to reduce CO by hydrogen, was related to the extent of carbide formation. Fournier et al. reported that the phases Fe5C2 and Fe were detectable both from X-ray diffraction patterns and from thermomagnetic curves taken from products which were quenched after 10 minutes of reaction time (at maximum activity). It was shown that the active catalysts formed from both Fe2O3 and metallic iron contain Fe5C2. Catalyst deactivation is most probably associated with unreactive graphite which is formed during the methanation process. There have been no reports concerning the crystallographic or magnetic properties of the system Fe5-xNixC2. Since Fe5C2 shows a Curie

point at 246 C, any substitution of nickel into the phase could be determined by changes in the Curie point. Furthermore, the optimum solubility of nickel into Fe5C2 could be determined from X-ray diffraction studies of members of the system Fe5-xNixC2. Since pure nickel does not appear to carbide under Fisher-Tropsch conditions, it should be present as a separate phase when maximum solubility is achieved. GRA

THE VARIATION OF THE DISLOCATION DENSITY IN ALUMINUM DEFORMED TO LARGE STEADY-STATE CREEP STRAINS M.S. Thesis
Timothy S. Wetter Mar. 1986 56 p
(AD-A167715) Avail: NTIS HC A04/MF A01 CSCL 11/6

This thesis reports trends in the variation of the subgrain size and density of dislocations not associated with subgrain boundaries (forest dislocations) in high purity aluminum with strain during primary and steady-state creep at temperatures in the power-law regime utilizing torsional deformation. Any microstructural feature responsible for strength is expected to be constant during steady-state deformation. Earlier work addressed changes in the subgrain size over a wide range of steady-state strain. A constant subgrain size was found. The present effort primarily examined the dislocation density but also further evaluated the conclusion of a constant subgrain size during steady-state. The subgrain size data were found consistent with the earlier work. In contrast to constant-stress tests in other investigations, it was found, here, that the forest dislocation density monotonically increased until a steady-state at a strain of approximately 0.20. The forest dislocation density is essentially constant at steady-state. These two findings are consistent with dislocation network theories for creep. Optical micrographs were taken from tangential sections of the torsion samples, which substantiated the finding that the subgrain size is fixed during steady-state. GRA

SEM/EDX (Scanning Electron Microscopy/Energy Dispersing X Ray Analysis) and scanning Auger microscope analysis were employed to characterize wear surfaces and debris on friction tested, laser processed metal-carbide composite surfaces. The friction and wear of the composite samples were found to be influenced by the compatibility (degree of mutual solubility) of the carbides with the steel counterface, as well as by local inhomogeneities in the carbide distribution. High fluence Ti implantation resulted in increased friction and wear, possibly due to an implantation induced softening or degradation of the carbides. Cavitation erosion tests were performed on nonimplanted and ion implanted samples of a Co based hardface alloy (Stoody 3). Erosion of the test samples was found to initiate by debonding at the carbide-matrix interfaces and by crack propagation through the carbides. The erosion mechanisms in the alloy were altered by both N and Ti implantations. Ti implantation, in particular, appeared to significantly increase the erosion resistance of the alloy. TEM (Transmission Electron Microscopy) studies were made on nonimplanted and ion implanted foils of Stoody 3, to investigate structural changes induced by implantation. Ti implantation produced a surface layer with an amorphous matrix phase and recrystallized carbides, while N implantation greatly increased the stacking fault density in the matrix phase. GRA

TO WHAT EXTENT ARE GRAIN BOUNDARIES IN METALS ORDERED STRUCTURES
R. W. Balluffi Sep. 1985 13 p
(Contract DE-FG02-84ER-45116)
(DE86-007004; DOE/ER-45116/9) Avail: NTIS HC A02/MF A01

It appears likely on the basis of present information that the structural unit/grain boundary dislocation model is applicable to all types of boundaries (short and long period, tilt, twist and mixed) at low temperatures (T less than T(sub m)/3). Such boundaries therefore consist of ordered arrays of various types of structural units which are generally systematically distorted to at least some extent over the boundary areas. These arrays obey a crystallography dictated by the base vectors of the units and the boundary periodicities. This ordered framework is not affected by a possible multiplicity of the units. The less extensive (and more contradictory) information available at high temperatures (T greater than T(sub m)/3) suggests that this same model is again generally applicable for at least many boundaries up to essentially T(sub m). However, increasing disorder in the form of increasing structural unit multiplicity and increasing vibrational amplitudes and anharmonicity may be expected. The possibility that more extensive disordering transitions occur well below T(sub m) in some boundaries (particularly long period boundaries with complex unit structures) cannot be precluded. DOE

CORROSION BEHAVIOUR OF ALUMINIUM PLATES IN AQUEOUS MEDIUM
M. F. deOliveira and J. C. Gaio 1985 9 p In PORTUGUESE Presented at the 12th National Seminar on Corrosion, Salvador, Brazil, 13 May 1985
(DE86-701575; INIS-BR-431; CONF-8505227-2) Avail: NTIS (US Sales Only) HC A02/MF A01

The process of corrosion of aluminum 1050 plate was studied at room temperature, 45 to 60 C, in deionized water from the Argonauta Reactor Water. In addition to the influence of temperature, the effect of chloride ions and oxygen were also verified. It was found that the amount of oxide formed at room temperatures is almost negligible. It was observed that there is risk of corrosion in the case of Reactor Water contaminated with chloride ions. The results have shown that the aluminum can be used since the medium is not strongly oxidizing. At potentials higher than - 900M sup(V) ess (-280 m sup(V) sub(H)), the material will undergo pitting corrosion. DOE

ANALYSIS OF HEAT-AFFECTED ZONE CRACKING IN NI3AI ALLOYS
M. L. Santella, M. C. Maguire, and S. A. David 1986 4 p Presented at the 67th Annual American Welding Society Meeting, Atlanta, Ga., 13 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009449; CONF-8604123-2) Avail: NTIS HC A02/MF A01

A key issue in the development of Ni3Al for engineering applications is their weldability. Detailed welding studies have been done which show that iron-containing nickel aluminides are prone to heat-affected zone (HAZ) cracking. Hot ductility testing of these alloys has suggested that grain boundary cohesive strength controls high temperature ductility and the resistance to HAZ cracking. This analysis cannot, however, be used to explain the behavior of other aluminide alloys. The intention of this work is to more fully characterize the relationship between mechanical behavior and HAZ cracking susceptibility for Ni3Al alloys. DOE

IN-VACUUM CYCLIC FATIGUE BEHAVIOR OF VANSTAR-7 AT ELEVATED TEMPERATURES
K. C. Liu 1986 6 p Presented at the American Nuclear Society Annual Meeting, Reno, Nev., 15 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-007322; CONF-860610-21) Avail: NTIS HC A02/MF A01

Refractory metal alloys have been proposed for fusion reactor and space power applications because of their high temperature strength, low thermal stress properties, good compatibility with liquid metal coolants and radiation resistance. However, little is known about the cyclic fatigue properties which are important to

some fusion reactor first wall systems that operate in thermal cycles. This paper presents limited results of in-vacuum cyclic fatigue tests on Vanstar-7 (9Cr-3Fe-Zr) at room temperature, 550 and 650(0)C. Miniature hourglass-shaped specimens were used with a gage diameter of 3.18 mm. The material was annealed 1 h in vacuum at 1400(0)C before machining, to produce an average grain size of ASTM No. 7. The specimens were stress relieved for 0.5 h at 1400(0)C after machining. Tests were performed on a servocontrolled hydraulic testing system equipped with a vacuum chamber capable of pressures below 10(-5) Pa. Specimens were heated by an induction heater, maintaining temperatures within +-2(0)C of the nominal temperature during the test. A diametral extensometer was used, but axial strain calculated via a strain computer was used for machine control. A fully reversed triangular wave function beginning with compression was employed at a strain rate of 4 x 10(-3) s(-1) for all low-cycles tests. High cycle testing was conducted initially in strain control but switched to load control after stable essentially elastic cycling was established. DOE

MECHANICAL PROPERTIES TESTING OF SEVERAL 800 MeV PROTON IRRADIATED BCC METALS AND ALLOYS
R. D. Brown, M. S. Wechsler, and C. Tschalaer 1986 25 p Presented at the 13th International Symposium on the Effects of Radiation on Materials, Seattle, Wash., 23 Jun. 1986 Prepared in cooperation with Iowa State Univ. of Science and Technology, Ames and Schweizerisches Inst. fuer Nuklearforschung, Villigen
(Contract W-7405-eng-36)
(DE86-007372; LA-UR-86-733; CONF-860605-4) Avail: NTIS HC A02/MF A01

A spallation neutron source for the 600-MeV proton accelerator facility at the Swiss Institute for Nuclear Research (SIN) consists of a vertical cylinder filled with molten Pb-Bi. The proton beam enters the cylinder, passing upward through a window in contact with the Pb-Bi eutectic liquid. Investigations are underway at the 800-MeV proton accelerator at LAMPF to test the performance of candidate SIN window materials. Based on considerations of chemical compatibility with molten Pb-Bi, as well as radiation damage mechanisms, Fe, Ta, Fe-2.25Cr-1Mo, and Fe-12Cr-1Mo (Ht-9) were chosen as candidate materials. Sheet tensile samples were sealed inside capsules containing Pb-Bi and were proton-irradiated at LAMPF to two fluences, 4.8 and 54 x 10(23) p/m(2). The beam current was approximately equal to the 1 mA anticipated for the upgraded SIN accelerator. Yield and ultimate strengths increased upon irradiation in all materials, while the ductility decreased. The pure metals, Ta and Fe, exhibited the greatest radiation hardening and embrittlement. The HT-9 alloy showed the smallest changes in strength and ductility. DOE

RADIATION-INDUCED SEGREGATION AND PRECIPITATION IN MOLYBDENUM-RHENIUM ALLOYS
R. A. Erck, C. M. Wayman, and L. E. Rehn Feb. 1986 20 p Presented at the 13th International Symposium on the Effects of Radiation on Materials, Seattle, Wash., 23 Jun. 1986 Prepared in cooperation with Illinois Univ., Urbana
(Contract W-31-109-eng-38)
(DE86-007521; CONF-860605-8) Avail: NTIS HC A02/MF A01

Specimens of Mo-7 at. % Re and Mo-30 at. % Re were irradiated with 1.8 MeV (4)He(+) ions at elevated temperatures. Radiation-induced segregation of Re was measured during irradiation by in situ Rutherford backscattering spectrometry. Segregation of the undersized Re atoms in the same direction as the defect fluxes, i.e., toward the external surface, was observed. The amount of Re enrichment in the near-surface region was measured as a function of temperature and of dose at a calculated near-surface displacement rate near 1 x 10(-4)dpa/s. Segregation was observed at temperatures from 800 to 1500(0)C in Mo-7Re, and from 850 to 1225(0)C in Mo-30Re. Irradiated disks were examined by transmission electron microscopy. Precipitates of Chi phase were observed on grain boundaries, or in a thin layer at the irradiated surface in Mo-30Re after irradiation at temperatures from 750 to 1075(0)C. Frequently, Chi precipitates formed with a crystallographic twin orientation with respect to the host matrix. No voids were observed for doses up to 1.6 dpa. DOE

N86-31716# Oak Ridge National Lab., Tenn.
EFFECT OF NEUTRON IRRADIATION ON THE TENSILE PROPERTIES AND MICROSTRUCTURE OF SEVERAL VANADIUM ALLOYS
D. N. Braski 1986 34 p Presented at the 13th International Symposium on the Effects of Radiation on Materials, Seattle, Wash., 23 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008234; CONF-860605-9) Avail: NTIS HC A03/MF A01

Specimens of V-15Cr-5Ti, VANSTAR-7, and V-3Ti-1Si were encapsulated in TZM tubes containing (7)Li to prevent interstitial pickup and irradiated in FFTF (MOTA experiment) to a damage level of 40 dpa. The irradiation temperatures were 420, 520, and 600(0)C. For a better simulation of fusion reactor conditions, helium was preimplanted in some specimens using a modified version of the tritium trick. The V-15Cr-5Ti alloy was most susceptible to irradiation hardening and helium embrittlement, followed by VANSTAR-7 and V-3Ti-1Si. VANSTAR-7 exhibited a relatively high maximum void swelling of approx. 6% at 520(0)C while V-15Cr-5Ti and V-3Ti-1Si had values of less than 0.3% at all three temperatures. The V-3Ti-1Si clearly outperformed the other two vanadium alloys in resisting the effects of neutron irradiation. DOE

ION DAMAGE MICROSTRUCTURES IN A Fe-10Cr-6Mo-0.5Nb
K. Farrell and E. H. Lee 1986 20 p Presented at the 13th International Symposium on the Effects of Radiation on Materials, Seattle, Wash., 23 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008500; CONF-860605-11) Avail: NTIS HC A02/MF A01

An annealed-and-aged ferritic steel containing fine NbC precipitates and relatively coarse particles of Laves phase was bombarded with 4-MeV iron ions to 100 displacements per atom (dpa) at 400 to 600(0)C. Much of the damage structure consisted of dislocation tangles that coarsened with increasing temperature. Cavity formation began at 450(0)C, peaked at 500 to 550(0)C and was absent at 600(0)C. Maximum swelling was only 0.2%. The Laves particles exhibited recoil dissolution and restructuring. Bombardments with Fe + He + D or Fe + He beams at ratios of 10 atomic parts per million (appM) He/dpa and 45 appM D/dpa introduced high concentrations of very small bubbles and comparatively few larger, bias-driven cavities. The latter were initiated at bubble clusters on NbC particles. Maximum swelling of 0.75% occurred at 550(0)C. Recoil dissolution of the Laves phase was retarded by the gases. Large critical cavity sizesand unbalanced dislocation and cavity sink strengths contribute to low swelling of this alloy. DOE

DESIGN OF TOUGH FERRITIC STEELS FOR CRYOGENIC USE
J. W. Morris, Jr. Oct. 1985 39 p Presented at the Symposium on Structure/Property Relationships, New Orleans, La., 3 Mar. 1986
(Contract DE-AC03-76SF-00098)
(DE86-009361; LBL-20485; CONF-8603110-1) Avail: NTIS HC A03/MF A01

This paper describes the design of ferritic steels and weldments that combine strength and toughness at cryogenic temperatures. The alloy must have a ductile-brittle transition temperature below the intended service temperature and a high fracture toughness in the ductile mode. Its systematic design uses the microstructure-property relations that govern the transition temperature and fracture toughness to identify a suitable microstructure, and then employs the microstructure-processing relations that govern its thermal response to manipulate the microstructure into the appropriate form. The procedure is illustrated by describing the heat treatments, microstructures and properties of a variety of laboratory and commercial alloys, including conventional 9Ni steel, the low-Ni and Fe-Mn ferritic steels that have been developed as

an alternative to 9Ni, the 12Ni steels that are promising for use at 4K, and the welding procedures and ferritic filler metals that are useful for ferritic cryogenic steels. DOE

INSIGHTS INTO THE FRACTURE TOUGHNESS OF MARTENSITIC STAINLESS STEELS USING STEREOSCOPIC FRACTOGRAPHIC MEASUREMENTS
D. S. Gelles Aug. 1985 5 p Presented at the Fundamental Aspects of Fracture, Gatlinburg, Tenn., 4 Nov. 1985
(Contract DE-AC06-76FF-02170)
(DE86-009415; HEDL-SA-3291; CONF-851104-2) Avail: NTIS HC A02/MF A01

Stereoscopic fractographs of precracked compact tension and precracked miniature Charpy specimens can provide critical crack opening displacements (delta/sub c/) on a microstructural scale. The critical crack opening displacement can be related to the critical crack extension force (G/sub c/) by the Wells relationship G/sub c/ = n sigma/sub y/ delta/sub c/ where n is the plastic stress intensity factor and sigma/sub y/ is the yield stress. This approach has been used to examine the fracture behavior of two martensitic stainless steels. Examinations on a microstructural scale were compared with J/sub Ic/ measurements in order to assess the validity of the Wells relationship. It was found that the two modes of crack extension, stretching and crack propagation, were clearly defined but that an intermediate stage also occurred. This intermediate stage was a precursor to crack propagation but differed from crack propagation in that crack tip blunting eventually slowed propagation and returned extension to the stretching mode. This intermediate stage is very localized, creates a unique fracture appearance and produces uncertainty in the determination of a precise value for J/subIc/. DOE

INFLUENCE OF RADIATION-INDUCED SEGREGATION ON DUCTILITY OF A NICKEL-SILICON ALLOY
N. H. Packan, H. Schroeder, and W. Kesternich 1986 17 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986 Prepared in cooperation with Kernforschungsanlage Juelich G.m.b.H., West Germany
(Contract DE-AC05-84OR-21400)
(DE86-009500; CONF-860421-26) Avail: NTIS HC A02/MF A01

Flat tensile specimens 60 microns thick of Ni-8 at. % Si were irradiated to bulk damage levels of 0.1 to 0.3 dpa with either 7 MeV protons or 28 MeV alpha particles at 750 K. The alpha bombarded specimens incurred 750 at. ppM He per 0.1 dpa in the course of their damage-generating irradiation. Radiation-induced silicon segregation gave rise to Ni3Si layers at internal and external surfaces. Postirradiation tensile tests conducted either at 300 K or 720 K revealed fully ductile (chisel-edged) transgranular fracture profiles. There were no significant differences between the proton-bombarded specimens and the unbombarded controls, both exhibiting greater than 25% total elongations, while the alpha-bombarded specimens showed ductile fractures with somewhat lower (17 to 18%) elongation values probably due to hardening caused by small helium bubbles. Certain specimens that were preimplanted with 250 to 1000 at. ppM He at 970 K to encourage intergranular failure and expose grain boundaries did fail intergranularly. It is concluded that radiation-induced silicon segregation does not cause intrinsic embrittlement. DOE

POSTIRRADIATION TENSILE BEHAVIOR OF NICKEL-DOPED FERRITIC STEELS
R. L. Klueh, P. J. Maziasz, and J. M. Vitek 1986 19 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009502; CONF-860421-25) Avail: NTIS HC A02/MF A01

Tensile specimens of normalized-and-tempered 9Cr-1MoVNb, 9Cr-1MoVNb-2Ni, 12Cr-1MoVW, 12Cr-1MoVW-1Ni, and 12Cr-1MoVW-2Ni were irradiated in the Experimental Breeder Reactor at 390, 450, 500, and 550(0)C to displacement-damage levels of approximately 16 dpa. The only difference in the effect of irradiation on the tensile behavior of the nickel-doped and undoped steels was attributed to the difference in tempering treatments the two types of steels received. The nickel-doped steels were stronger prior to irradiation due to a lower tempering temperature. After irradiation, the properties of the steels with and without nickel were similar, indicating that the presence of nickel did not affect the behavior of the steels during irradiation. Nickel was added to the steels to study the effect of helium on the properties of these steels. Helium can be formed in an alloy containing nickel by irradiating in a mixed-spectrum reactor. To help determine the effect of helium on properties, these steels are also being irradiated in fast reactors, where little helium is formed. The present fast-reactor results indicate that it is feasible to use the nickel-doped ferritic steels to study helium effects. DOE

EFFECT OF HEAT TREATMENT AND IMPURITY CONCENTRATION ON SOME MECHANICAL PROPERTIES V-15Cr-5Ti ALLOY
B. A. Loomis, B. J. Kestel, and D. R. Diercks Mar. 1986 15 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract W-31-109-eng-38)
(DE86-010498; CONF-860421-36) Avail: NTIS HC A02/MF A01

The effects of heat treatment and O, N, C, Si, and S impurity level on the yield strength, ductility, and fracture mode for specimens from four different heats of the V-15Cr-5Ti alloy are presented. The heat treatments for the alloy consisted of annealing as-rolled material for one hour at either 950, 1050, 1125, or 1200C. The total oxygen, nitrogen, and carbon impurity concentration ranged from 400 to 1200 wppm. The Si concentration ranged from 300 to 1050 wppm, and the S concentration ranged from 440 to 1100 wppm. The yield strength and ductility for the alloy, regardless of impurity concentration, exhibited minimum and maximum values, respectively, for the 1125C anneal. The primary mode of failure for the tensile specimens was transgranular fracture. DOE

EFFECT OF HELIUM ON SWELLING AND MICROSTRUCTURAL EVOLUTION IN ION-IRRADIATED V-15Cr-5Ti ALLOY
B. A. Loomis, B. J. Kestel, S. B. Gerber, and G. Ayrault Mar. 1986 29 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract W-31-109-eng-38)
(DE86-010510; CONF-860421-34) Avail: NTIS HC A03/MF A01

An investigation was made on the effects of implanted helium on the swelling and microstructural evolution that results from energetic single- and dual-ion irradiation of the V-15Cr-5Ti alloy. Single-ion irradiations were utilized for a simulated production of the irradiation damage that might be expected from neutron irradiation of the alloy in a reactor with a fast neutron energy spectrum (E > 0.1 MeV). Dual-ion irradiations were utilized for a simulated production of the simultaneous creation of helium atoms and irradiation damage in the alloy in the MFR environment. Experimental results are also presented on the radiation-induced segregation of the constituent atoms in the single- and dual-ion irradiated alloy. DOE

OVERVIEW OF TRANSPORT MECHANISMS IN BETA-LITHIUM/ALUMINUM
S. Susman, T. O. Brun, and K. J. Volin Mar. 1986 6 p Presented at the International Workshop on High Temperature Molten Salt Batteries, Argonne, Ill., 16 Apr. 1986
(Contract W-31-109-eng-38)
(DE86-010522; CONF-8604116-2) Avail: NTIS HC A02/MF A01

A systematic study over a period of years has resulted in identifying: (1) constitutional defects in -LiAl at room temperature, and (2) defects created at elevated temperatures. The relationship

between these defects and charge and mass transport is discussed. The results bear upon the use of LiAl as the negative electrode both in room-temperature and solid state batteries and in high-temperature, molten-salt electrochemical cells. The key to unravelling the Li-conduction mechanism has been the recognition that there is a critical composition within the -phase domain corresponding to 50.7 at. % lithium. Free Li vacancies, bound Li vacancies, and reciprocal antisite defects contribute to the transport processes depending on temperature and composition. An understanding of these microscopic mechanisms has been used to remedy the loss of capacity with cycling of high temperature electrochemical cells. DOE

CORRELATION BETWEEN MICROSTRUCTURE AND FORGING CONDITIONS OF COMBINED DIE-FORGED (CDF) TI-6AI-4V POWDER
Wilfried Smarsly May 1986 154 p
(ESA-TT-952; DFVLR-FB-85-29; ESA-86-98076) Avail: NTIS HC A08/MF A01; German version available from DFVLR, Cologne, West Germany DM 47.50

Titanium-6Al-4V alloy powder in a steel can and a copper fluid die was compacted and forged and annealed at 950 C in an extrusion container by a hydraulic press and high velocity hammer using the combined die forging process to investigate its effects on the material porosity and morphology, on the powder alloy texture, and on the microstructure of the forged material. The results are required for development and optimization of a one-operation production procedure for components made of powder materials. The CDF process improves the fatigue properties and is adequate for the manufacturing of thick powder materials with optimal metallurgical microstructure and mechanical properties. Investigations of the ductility, strength and fatigue properties of the powder materials under the combined die forging conditions are recommended. ESA

Novel amine terminated bisaspartimides are prepared by a Michael-type reaction of an aromatic bismaleimide and an aromatic diamine in an aprotic solvent. These bisaspartimides are thermally polymerized to yield tough, resinous polymers cross-lined through -NH- groups. Such polymers are useful in applications requiring materials with resistance to change at elevated temperatures, e.g., as lightweight laminates with graphite cloth, molding material prepregs, adhesives and insulating material. EFFECT OF CRYSTALLOGRAPHICAL AND GEOMETRICAL CHANGES OF A FERRITE HEAD ON MAGNETIC SIGNALS DURING THE SLIDING PROCESS WITH MAGNETIC TAPE
Kazuhisa Miyoshi, Donald H. Buckley, and Kyuichiro Tanaka (Kanazawa Univ., Japan) 1986 26 p Presented at the Joint Tribology Conference, Pittsburgh, Pa., 19-22 Oct. 1986; sponsored by ASLE and ASME
(NASA-TM-87277; E-2955; NAS 1.15:87277) Avail: NTIS HC A03/MF A01 CSCL 14E

This paper reviews changes in the crystalline structure and geometry of lapped Mn-Zn ferrite heads in sliding contact with magnetic tape and the effects of these changes on magnetic signals. A highly textured, polycrystalline structure was produced on the surface of a single-crystal Mn-Zn ferrite head when it was finished with an aluminum oxide lapping tape. Sliding this lapped surface against a magnetic tape produced a nearly amorphous structure. The sliding process led to a degradation in readback signal of 1 to 2 dB (short-wavelength recording). Furthermore, wear of the magnetic head caused geometrical changes in the head surface. The signal read back with the worn magnetic head was sensitive to operating parameters such as head displacement and tape tension. A change in operating parameters created head-to-tape spacings and, consequently, excessive gains or losses in the readback signal. Author

CORRELATION OF PROCESSING AND SINTERING VARIABLES WITH THE STRENGTH AND RADIOGRAPHY OF SILICON NITRIDE
William A. Sanders and George Y. Baaklini (Cleveland State Univ., Ohio) 1986 37 p Presented at the Tenth Annual Conference on Composites and Advanced Ceramic Materials, Cocoa Beach, Fla., 19-24 Jan. 1986; sponsored by the American Ceramic Society
(NASA-TM-87251; E-2934; NAS 1.15:87251) Avail: NTIS HC A03/MF A01 CSCL 11G

A sintered Si3N4-SiO2-Y2O3 composition, NASA 6Y, was developed that reached four-point flexural average strength/standard deviation values of 857/36, 544/33, and 462/59 MPa at room temperature, 1200 and 1370 C respectively. These strengths represented improvements of 56, 38, and 21 percent over baseline properties at the three test temperatures. At room temperature the standard deviation was reduced by over a factor of three. These accomplishments were realized by the iterative utilization of conventional x-radiography to characterize structural (density) uniformity as affected by systematic changes in powder processing and sintering parameters. Accompanying the improvement in mechanical properties was a change in the type of flaw causing failure from a pore to a large columnar beta- Si3N4 grain typically 40 to 80 microns long, 10 to 30 microns wide, and with an aspect ratio of 5:1. LUBRICATION HANDBOOK FOR THE SPACE INDUSTRY. PART A: SOLID LUBRICANTS. PART B: LIQUID LUBRICANTS

Ernest L. McMurtrey Dec. 1985 419 p
(NASA-TM-86556; NAS 1.15:86556) Avail: NTIS HC A18/MF A01 CSCL 11H

This handbook is intended to provide a ready reference for many of the solid and liquid lubricants used in the space industry. Lubricants and lubricant properties are arranged systematically so that designers, engineers, and maintenance personnel can conveniently locate data needed for their work. This handbook is divided into two major parts (A and B). Part A is a compilation of solid lubricant suppliers information on chemical and physical property of data of more than 250 solid lubricants, bonded solid lubricants, dispersions, and composites. Part B is a compilation of chemical and physical porperty data of more then 250 liquid lubricants, greases, oils, compounds, and fluids. The listed materials cover a broad spectrum from manufacturing and ground support to hardware applications of spacecraft. Author

NOVEL MACROMOLECULAR STRUCTURES AND COMPOSITES Final Report, 1 Aug. 1983 - 31 Jul. 1984
Frank E. Karasz Jun. 1985 12 p
(Grant AF-AFOSR-0341-83)
(AD-A166243; AFOSR-86-0143TR) Avail: NTIS HC A02/MF A01 CSCL 11/4

The Dynastat mechanical testing instrument purchased under the URIP Grant is now fully operational. It is presently being used to a large extent for research involving the Farris research group. The projects primarily influenced and which constitute about 90% of the time on the instrument are the AFML, Molecular Composites Program and a DOD LOVA program. The instrument is sufficiently versatile that it can be used for a multitude of materials and is especially useful for very stiff materials, a region where most instruments fail. As an example of the type of data that can be taken we have included some recent data. Illustrated is the in-phase modulus in uniaxial compression of a polyacetal-polyurethane thermoplastic elastomer as a function of frequency at several temperatures. Also shown is the master curve for this material using the computerized timer-temperature/frequency-temperature shifted data. Also included are reduced data at 40% and 60% filler content. Finally, the curing of a graphite-epoxy prepreg in shear during cure is shown. In this experiment the sample is being increased in temperature linearly with time. The prepreg softens at about 50 C and little happens until 160 C where reaction commences, as illustrated by a drop in the loss factor and an increase in the stiffness. It is currently being used to develop a new Impulse Method of Viscoelastic characterization which related time-integrals of stress to time integrals of strain for pulse. GRA

ELECTRICAL AND ENVIRONMENTAL STUDIES OF CONDUCTION POLYMERS Final Report, 14 Sep. 1984 - 14 Oct. 1985
Mark A. Druy 17 Jan. 1986 63 p
(Contract N62269-84-C-0274)
(AD-A167737; NADC-86020-60) Avail: NTIS HC A04/MF A01 CSCL 11/9

The objective of this research was to present a clear and defined strategy toward the synthesis of environmentally stable conducting polymers, paying particular attention to the influence of the dopant on the electrical conductivity, environmental stability, and the dielectric properties. This involves a fundamental understanding of the molecular basis for the electrical properties and the interaction of the dopant with the polymer backbone. On the basis of an investigation into the kinetics of the degradation of electrical conductivity in two conducting polymer systems, it was identified which is thermally stable in an inert atmosphere and whose degradation of conductivity when exposed to air follows first order kinetics. Specific examples are polypyrrole/toluene sulfonate and multicomponent system comprising polypyrrole, toluene sulfonate, and a processible polymeric component. The capability to predict adequately the environment stability of a conducting polymer on the basis of a kinetic treatment of accelerated life tests was also demonstrated for the first time. Another conducting polymer system, namely multicomponent polythiophene/poly THF was found to be less stable with respect to polyprrole and it follows a multi-order degradation process in laboratory air. The dielectric properties of the above materials were investigated over the frequency rate from 1-100 GHZ. GRA

EXPLORATION OF ADVANCED CHARACTERIZATION TECHNIQUES FOR MOLECULAR COMPOSITES Final Report, Feb. 1984 - Jan. 198
D. L. VanderHart, F. W. Wang, R. K. Eby, B. M. Fanconi, and K. L. DeVries Feb. 1986 183 p
(Contract MIPR-FY1457-84-N-5019; AF Proj. ILI-R)
(AD-A168102; AFWAL-TR-85-4137) Avail: NTIS HC A09/MF A01 CSCL 07/4

The techniques of solid state nuclear magnetic resonance, fluorescence spectroscopy, electron spin resonance, and X-ray diffraction were applied to characterize aspects of the solid state structures of rigid rod polymers and their blends with flexible polymers. NMR and fluorescence spectroscopies were used to investigate the degree to which the rigid rod - flexible polymer blends exist as phase separated systems. It was found that these materials form primarily phase segregated structures, a condition which limits the reinforcing potential of rigid rod polymers in molecular composites. Most specimens exhibited NMR signals indicative of mobile, and presumably lower molecular weight, species. It is postulated that these mobile species are either water or residual acid from which the materials are processed. Information regarding the location of the mobile species in the structures exhibited by rigid rod polymers and their blends with flexible polymers is deduced from NMR. Electron spin resonance measurements confirmed that free radicals are generated while mechanically stressing rigid rod polymer fibers. The as-processed fibers contained appreciable levels of free radicals and annealing at elevated temperatures caused a decrease in the free radical concentration by a factor of three. X-ray diffraction experiments were conducted at elevated pressure in a diamond anvil cell. GRA

EVIDENCE FOR THE FORMATION OF A METASTABLE CRYSTALLINE PHASE DURING CRYSTALLIZATION OF Zr-Ni METALLIC GLASSES OF APPROXIMATELY 57 TO 63.2 AT. % Zr
C. G. McKamey, D. S. Easton, and D. M. Kroeger 1985 7 p
Presented at the Materials Research Society Meeting, Boston, Mass., 2 Dec. 1985
(Contract DE-AC05-84OR-21400)
(DE86-005031; CONF-851217-25) Avail: NTIS HC A02/MF A01

The crystallization of rapidly solidified Zr-Ni metallic glasses has been studied by differential scanning calorimetry (DSC), X-ray diffraction (XRD), and transmission electron microscopy (TEM). Evidence has been found for a metastable phase which is the first crystalline phase to form upon heating in compositions of 57 to 63.2 at. % Zr. This phase seems to be more easily formed and is most stable in the region of 58 to 59 at. % Zr. Upon subsequent heating to higher temperatures, the metastable phase transforms to the equilibrium phases ZrNi and Zr2Ni. The relationship of this new phase to phase separation at the eutectic composition of 63.5 at. % Zr is discussed in support of the conclusions drawn from low temperature specific heat studies reported previously. CHEMICAL VAPOR INFILTRATION OF FIBER-REINFORCED CERAMIC COMPOSITES
D. P. Stinton, A. J. Caputo, R. A. Lowden, and T. M. Besmann 1986 8 p Presented at the 2nd International Sympoisum on Ceramic Materials and Components for Engines, Luebeck-Travemuende, West Germany, 14 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-009513; CONF-860413-1) Avail: NTIS HC A02/MF A01

A process has been developed for the fabrication of fiber-

reinforced SiC composites by chemical vapor infiltration. Infiltration times for the low-density fibrous structures were reduced significantly from previous processes by simultaneously utilizing a thermal gradient and forced gas flow. Uniform matrix deposition occurred throughout unidirectional-fiber, cloth, or random chopped-fiber preforms to produce composites with densities approaching 90% of theoretical. Fabrication of composites in this fashion produced specimens with high flexural strengths and with a strain at maximum load which significantly exceeded those of conventional SiC bodies. DOE

ANALYSIS OF S-GLASS CERAMIC LOT NO. 84-132 FOR USE AS A STANDARD REFERENCE MATERIAL
R. M. Merrill, J. P. McCarthy, and R. J. Antepenko Apr. 1986 43 p Prepared in cooperation with Mound Lab., Miamisburg, Ohio and General Electric Co., Largo, Fla.
(Contract DE-AC04-76DP-00789)
(DE86-010309; SAND-86-0065) Avail: NTIS HC A03/MF A01

Silicate glass properties such as thermal coefficient of expansion, and molten viscosity can be altered by changing the formulation. One glass, called S-glass ceramic, and hereafter denoted simply as S-glass, has been specifically designed to be crystallized to a glass ceramic with a coefficient of expansion that matches Inconel 718, and has a molten viscosity low enough to flow into tight configurations without the formation of voids or bubbles. Since the glass must meet rigorous chemical and mechanical specifications, samples from each batch or lot have been chemically analyzed. A major difficulty in these analyses has arisen from a lack of suitable standards. NBS has several silicate glasses certified as standard reference materials; however, none of them contains all of the constituents present in S-glass, and for some of the constituents no standard exists which has a certified value close to the levels present in S-glass. For these reasons, it was decided that one complete melt of S-glass would be extensively analyzed by several different laboratories and dedicated for use as a reference standard. The batch's melting history was closely monitored, and the starting materials were well characterized. DOE

LASER PROCESSING OF CERAMICS Final Technical Report, 1 Jun. 1981 - 30 Nov. 1985
G. L. Messing, J. P. Pollinger, R. Geary, and R. Shelleman May 1986 10 p
(Contract DE-AC02-81ER-10949)
(DE86-011954; DOE/ER-10949/T2) Avail: NTIS HC A02/MF A01

Progress towards understanding the nature of laser-ceramic interactions and their utilization for ceramic processing has been made. Correlations between observations on laser scanned ceramic substrates have been made to the laser-metal interaction literature. Correlations with melt solidification of metals, although a considerably different material system, have proven fruitful and have led to more insights about the thermodynamic and mechanistic nature of ceramic melt solidification. The original purpose of this study was to exclusively use a CO laser for ceramic melting and specifically to prepare ceramic powders. Unfortunately, it has not been possible to satisfactorily investigate powder preparation per se. Therefore, the results reported are primarily concerned with investigations of laser-ceramic interactions which involve rapid solidification of surfaces at cooling rates of 10^4 to 10^6 K/s. Because of the continuing interest in powder synthesis a plasma vaporization of solutions technique was investigated. The vapor synthesis method was adapted because of its potential utility for a wide range of material compositions. DOE

MOLECULAR WEIGHT DISTRIBUTIONS OF DURHAM POLYACETYLENE PRECURSOR POLYMERS
Kevin Harper and Peter G. James 1985 4 p
(ESA-86-97254) Avail: NTIS HC A02/MF A01

A low temperature gel permeation chromatography system was developed and used to obtain the molecular weight distributions of Durham polyacetylene precursor polymers. A concurrent light-scattering experiment indicates that the true weight-average molecular weights of the Durham-type polymers are approximately twice the polystyrene-equivalent molecular weights. Durham precursor polymers are genuine high molecular weight polymers, producing initially cis polyacetylene with up to 7,500 double bonds. ESA

HIGH TEMPERATURE ADHESIVES [LES ADHESIVES HAUTES TEMPERATURES]
P. Hebrard 1986 14 p In FRENCH Presented at GAMNI Assemblage par Collage dans l'Ind., Senlis, France, 8-9 Oct. 1985
(SNIAS-861-422-113; ESA-86-97603) Avail: NTIS HC A02/MF A01

The analysis of four adhesive systems capable of operation over 200 C is presented. Differential thermal analysis, thermogravimetric tests and dynamic viscoelastic analysis were carried out. Samples of epoxy-phenolic, polyimidic, and bismaleicimide adhesives were studied. The optimum polymerization cycles deduced from the tests are described. All the four systems are superior to epoxy adhesives and may work up to near 400 C. Polyimides are the most promising. ESA

DIFFUSION OF WATER VAPOR IN CFRP. MEASUREMENT OF THE DIFFUSION COEFFICIENT UNDER INFLUENCE OF CONCENTRATION
Harald Twardy Sep. 1985 70 p Original language document was announced as N85-24018
(ESA-TT-911; DFVLR-FB-84-41; ESA-86-97568) Avail: NTIS HC A04/MF A01; original German version available from DFVLR, Cologne, West Germany DM 23

The diffusion coefficient of water vapor in CFRP was measured as a function of moisture content for epoxy resins Code 69 and BSL 914, and their carbon fiber laminates. In sorption and desorption mode, tested materials show considerable variation of the diffusion coefficient with moisture content. Time-dependent influences, which cannot be separated, appear in this dependency. An example with a varying and an equivalent constant diffusion coefficient is calculated and demonstrates differences of calculated moisture profiles in a CFRP laminate. ESA

DETERMINATION OF THE FRACTURE TOUGHNESS OF CERAMIC MATERIALS ON BENDING SAMPLES WITH DIFFERENT NOTCH TYPES, AT ROOM TEMPERATURE AND HIGH TEMPERATURE Ph.D. Thesis - Karlsruhe Univ., West Germany
Guenther Himsolt Dec. 1985 255 p In GERMAN; ENGLISH summary
(DFVLR-FB-85-67; ISSN-0171-1342; ESA-86-97585) Avail: NTIS HC A12/MF A01; DFVLR, Cologne, West Germany DM 113.50

A method which permits the determination of the crack length using simple relations from the corresponding compliance of a bending specimen was developed. Investigations on hot-pressed silicon nitride reaction-bonded SN and HPSiC show that the microstructural parameters and their dependence on the testing temperature mainly control the fracture toughness. Specimens with a straight-through notch show a dependence on the notch radius, and chevron-notched specimens reveal deteriorated crack initiation which can lead to a failure of the method. Materials can show an increase in fracture toughness with increasing crack length. Fractographic investigations indicate that the test method must be adapted to specific materials problems. Because of the difficulties with both notch types, a modified chevron notch is suggested. ESA

A REVIEW OF METHODS TO DETERMINE THE IGNITABILITY OF PYROTECHNIC COMPOSITIONS
Leo V. DeYong Feb. 1986 24 p
(AD-A167429; MRL-R-989) Avail: NTIS HC A02/MF A01 CSCL 21/2

Ignition of pyrotechnic materials is a problem that has had relatively little attention over the years. However, many tests have been developed in an attempt to measure the ability of an energetic material to ignite from various sources. These tests range from the simple sensitivity/safety type tests (spark and impact sensitivity, ignition temperature, etc.) to the more complex techniques which measure the energy required for ignition (hot wire, laser, arc-image furnace, spark). These tests are examined in this report and comments on each of their advantages/disadvantages and their applicability to studying pyrotechnic ignition are made.

PREDICTION OF IGNITION TRANSFER RELIABILITY IN PYROTECHNIC SYSTEMS USING THE VARICOMP TECHNIQUE
Leo V. DeYong Feb. 1986 18 p
(AD-A167430; MRL-R-898) Avail: NTIS HC A02/MF A01 CSCL 21/2

The reliability of transfer of ignition between two elements in an explosive train is of paramount importance to proper functioning of a device. Prediction of this reliability is therefore necessary in designing ignition systems. To overcome testing prohibitively large numbers of samples, penalty testing was developed. The VARICOMP technique is one such penalty test developed for explosive trains. This report examines the theory of the VARICOMP technique and applies it to predicting ignition reliability in pyrotechnic trains. This study shows that a modified VARICOMP technique can be used in conjunction with small sample theory to predict the available stimulus from an igniter in a pyrotechnic system and the ignition reliability of the acceptor pyrotechnic. The use of the Bruceton calibration technique can provide adequate precision and makes elaborate and expensive calibration experiments unnecessary. However, for reliable predictions to be obtained, care must be taken to design the experiment to simulate the actual design hardware as closely as possible. GRA

AN EXPERIMENTAL INVESTIGATION OF VARIOUS METALLIC/POLYMER FUELS IN A TWO-DIMENSIONAL SOLID FUEL RAMJET M.S. Thesis
Charles K. Scott, III Mar. 1986 62 p
(AD-A167889) Avail: NTIS HC A04/MF A01 CSCL 21/5

An experimental investigation was conducted of highly metallized (approximately 70% by weight) solid fuels burned in a two-dimensional solid fuel ramjet (SFRJ). High speed motion pictures were taken of the combustion process through viewing windows located at two locations along the fuel slab length. Films revealed various ejection events ranging from small particle ejections to large flakes of burning and non-burning material leaving the surface. Nine different fuels were tested at air mass fluxes of 0.2 and 0.5 pounds mass per inch squared per second and pressures ranging from 35 to 200 psia. There was evidence that both minor binder ingredient changes (polymer and curative) and the inclusion of magnesium resulted in larger required inlet step heights to sustain combustion. Most of the metallized fuels did not burn well at pressures below approximately 40 psia. Low air mass fluxes generally resulted in larger metallic surface agglomerations, larger particles in the gas phase and more dominant shedding of surface layers. GRA

ADVANCED HYDROGEN STORAGE: MODIFIED VANADIUM HYDRIDES Final Report
G. G. Libowitz Aug. 1985 33 p
(Contract DE-AC02-76CH-00016)
(DE86-009916; BNL-37866) Avail: NTIS HC A03/MF A01

Body centered solid solution alloys of general composition V-Ti-M (where M = Fe, Mn, Cr, Al) were investigated for use as hydrogen storage materials. Phase relations and thermodynamic properties of the V-Ti-M-H systems were determined. It was found that the enthalpies and entropies of hydride formation were significantly higher (absolute values) than those of most intermetallic compounds. Because of their thermodynamic properties it was concluded that these alloy hydrides are not particularly suitable for hydrogen storage, but that the thermodynamic properties are most favorable for their use as hydrogen compressors or in hydride heat pumps. HC A02/MF A01

Results are presented of an investigation into the shock initiation of high explosives with respect to the effects of density and grain sizes. The investigators used a model of treating high-explosive reaction with a multistep process which includes the hot-spot excitation, decomposition, and the propagation of reaction into the region outside the hot spots. The roles of various parameters are discussed; in particular, the hot-spot mass fraction, the reference hot-spot temperature, and the temperature sensitivity parameter are cited as the key factors in the observed behaviors. DOE

N86-31750# Los Alamos National Lab., N. Mex.
RADIAL BUILDUP TO DETONATION IN PENTAERYTHRITOL TETRANITRATE (PETN)
R. H. Dinegar Oct. 1985 9 p Presented at the International Symposium on Intense Dynamic Loading and its Effects, Beijing, China, 3 Jun. 1986
(Contract W-7405-eng-36)
(DE86-002383; LA-UR-85-3554; CONF-860616-6) Avail: NTIS HC A02/MF A01

Purified PETN was pressed to a density of 0.95 g/cc in Lucite cylinders of 2.54-cm diameter and 0.76-cm length. These charges were initiated by means of an exploding bridgewire located in the center of one face of the pressing. The firing capacitance and inductance were held constant. The energy delivered to the explosive charge was changed by varying the condenser voltage. The radial buildup to detonation was recorded by a rotating mirror camera with the slit perpendicular to the bridgewire. Results are discussed. The conclusion is that the deflagration to detonation development is not perfectly spherical from the initiation source but more ellipsoidal with the highest rate oriented along the charge length. EFFECTS OF WELLBORE LIQUIDS IN PROPELLANT-BASED FRACTURING
J. F. Cuderman 1986 8 p Presented at the 27th US Symposium on Rock Mechanics, Tuscaloosa, Ala., 23 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-007832; SAND-85-2075C; CONF-860609-8) Avail: NTIS HC A02/MF A01

In situ experiments at the Department of Energy's Nevada Test Site (NTS) have extended the technology of propellant-based fracturing to include liquid-filled, uncased boreholes. Previous work had developed the technology for liquid-free, uncased wellbores. Test results show tha fracturing behavior is considerably more complex in liquid-filled boreholes than in the liquid-free case. Compared to liquid-free boreholes, liquid-filled boreholes have faster pressure risetimes and lower peak pressures, large hydraulic-type fractures propagating several meters beyond the end of the test zone, numerous oscillations in the pressure history, and variable types of fracturing within a single test region. Multiple fracturing is initiated in the wellbore of a fluid-filled borehole when the proper propellant mixture is used but, unlike fluid-free wellbores where up to eight fractures propagate, only one to three hydraulic- and/or shear-type fractures propagate. Hydrodynamic effects involving liquid compression during borehole pressurization appear to be responsible for the differing phenomena observed in fluid-filled boreholes. DOE

OPTICAL STUDIES OF CHEMICAL ENERGY RELEASE DURING SHOCK INITIATION OF GRANULAR EXPLOSIVES
R. E. Setchell 1985 33 p Presented at the 10th International Colloquium on Dynamics of Explosions and Reactive Systems, Berkeley, Calif., 4 Aug. 1985
(Contract DE-AC04-76DP-00789)
(DE86-010469; SAND-85-0760C; CONF-850830-9) Avail: NTIS HC A03/MF A01

Achieving a predictive understanding of shock growth to detonation in granular explosives requires an accurate description of the temporal and spatial behavior or chemical energy release following shock compression. Direct experimental observations of the complex mechanisms involved are very difficult, and global reaction rates are typically inferred from pressure or particle velocity measurements. In the present study, visible emission from an explosive/window interface is examined using instrumentation that provides spectral, temporal, and spatial resolution. This instrumentation includes an image-converter streak camera to record histories of emission intensities dispersed by a 0.25 m specrometer, an image-converter framing camera to record multiple images of a highly magnified area of the explosive surface, and a channel intensifier tube to greatly enhance the sensitivity of either camera. Planar impact experiments were conducted on a compressed-gas gun facility using samples of the explosives hexanitrostilbene and PBX-904. The streak emission records show a distinct structure within the earliest observable emission. DOE

N86-31753# Lawrence Livermore National Lab., Calif.
STUDY ON THE RHEOLOGY OF RX-08-FK LLNL'S PASTE EXPLOSIVE
E. vonHoltz Apr. 1986 30 p
(Contract W-7405-eng-48)
(DE86-010781; UCID-20737) Avail: NTIS HC A03/MF A01

Understanding the rheological properties of paste explosives (PEX) is vital to utilizing this technology in any application. We recently completed testing our current paste candidate, RX-08-FK. This PEX exhibited non-Newtonian flow properties, and could be analyzed via use of power law curves. Neglecting yield stress, the PEX data followed power law behavior, with the exponents (n) being in the region of 0.3 to 0.6 (expected region was 0.35 to 0.65). This classifies the PEX as having strongly pseudoplastic behavior (decreasing apparent viscosity with increasing shear rate). Using information extracted from this data, we were able to conclude that pressure transfer of this material from one configuration to another is a highly feasible concept. We estimate that to transfer 60 lb of our PEX through 4 feet of 1 inch ID tubing at 50°F, we would need a driving pressure of only 500 psi to accomplish the extrusion in less than 20 seconds. DOE

NON-CONTACT POLISHING Patent Application
Brian S. Ahern, inventor (to Air Force) Filed 15 Jan. 1986 10 p
(AD-D012210; US-Patent-Appl-SN-818944) Avail: NTIS HC A02/MF A01 CSCL 20/12

A non-contact polishing apparatus is used for polishing semiconductor planar substrates. The substrate is set back from any surface and is held by a chuck fixed within a collar. This substrate holder assembly is placed within an enclosed container that has a non-abrasive solution therein. The container is mounted

to a high speed nutating table that provides random motion to the holder assembly. This action provides isotropic polishing with no polishing created defects on the substrate surface. GRA

LASER INDUCED SELECTIVE ELECTROLESS PLATING Patent Application
Michael J. Halliwell, inventor (to Air Force) Filed 17 Jan. 1986 14 p
(AD-D012223; US-Patent-Appl-SN-819558) Avail: NTIS HC A02/MF A01 CSCL 13/8

It is an object of the present invention to provide a novel method for selective maskless electroless plating. In accordance with the present invention there is provided a method for selectively plating a metal onto a workpiece which comprises, in combination, the steps of applying a sensitizing solution to the workpiece, directing a laser beam onto the workpiece in the area which is not to be plated, and thereafter contacting the workpiece with an electroless plating solution to achieve plating thereon. CONTROL OF PRECIOUS METAL PLATING BATHS USING ELECTROGRAVIMETRIC ANALYSIS
W. G. Yelton 1986 13 p Presented at the 10th International Conference on Precious Metals, Lake Tahoe, Nev., 8 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-005435; SAND-85-2550C; CONF-860677-1) Avail: NTIS HC A02/MF A01

This paper is an outline of an electrogravimetric method for inventory control of precious metal plating baths. The procedure is meant to be applicable to a plating shop environment to provide in-process control. A short review of procedural techniques for sample preparation and analysis are included. The paper deals with the basic how to approach for developing a practical system of analytical control of precious metal electroplating baths permitting accountability of 99% or greater. DOE

The major technical tasks that led to the definitions of operational and demonstration multiple beam antenna (MBA) flight systems and a proof of concept model (POC) are described. Features of the POC Model and its measured performance are presented in detail. Similar MBA's are proposed for transmitting and receiving with the POC Model representing the 20 GHz transmitting antenna. This POC MBA is a dual shaped-surface reflector system utilizing a movable free array to simulate complete CONUS coverage. The beam forming network utilizes ferrite components for switching from one beam to another. Measured results for components, subsystems and the complete MBA confirm the feasibility of the approach and also show excellent correlation with calculated values. Author

SIMULATION STUDY SYNTHETIC APERTURE RADAR IMAGERY (SIMSAR) [SIMULATIESTUDIE SAR-BEELDVORMING (SIMSAR)]
Apr. 1984 15 p In DUTCH
(ESA-86-97554) Avail: NTIS HC A02/MF A01

Investigations into the numerical simulation of a SAR system are presented. A quasi two-dimensional model for a collection of point objects was extended to three dimensions. Software for calculating the rough radar signal via the frequence domain was derived. Existing software was extended with the implementation of a SAR-processor. Multilook SAR was simulated and its transfer functions were determined. The power density spectrum (PDS) of the theoretical model was compared with the PDS of the simulated data and the real SAR-data. For individual titles, see N86-31762 through N86-31763.

Investigations into the numerical simulation of a SAR system are presented. Software for calculating the rough radar signal (RRS) via the frequency-domain, was derived. The RRS was calculated in a 1024 point-objects area (with mutual 10 wavelengths distance) in flight direction. Existing software was extended with the implementation of a SAR-processor, consisting of a matched filter from which the transfer-function is anew to be determined for each distance. Part of the Doppler-spectrum was selected by filtering. Speckle was reduced counting subspectra signals on power base. Transfer functions were determined using Gauss functions in the frequency and time-domain. The power density spectrum (PDS) of the theoretical model was compared with the PDS of the simulated data and the real SAR-data. ESA

23-32)
Avail: NTIS HC A02/MF A01

Investigations into the numerical simulation of a SAR-system are presented. A quasi two-dimensional model for a Collection of Point Objects (CPO) was extended to three dimensions. Assuming an isotropic dispersion of reflecting electromagnetic waves, every point object is described by strength and random phase. The radar platform is introduced and an expression for the voltage received (i.e., echo of the CPO) was derived. Necessary software, i.e., (1) the mixing of the rough signal of a Gaussic pulse radar, (2) the implementation of the SAR-processor, and (3) the generation of images which can be elaborated, was briefly described. Matrix multiplication and time-frequency domain transformations were carried out on an array-processor. ESA

SCATTERING FROM A PLANAR EQUIANGULAR SPIRAL ANTENNA M.S. Thesis
Stephen C. Moraites Dec. 1985 68 p
(AD-A167068; AFIT/GE/ENG/85D-27) Avail: NTIS HC A04/MF A01 CSCL 09/5

This thesis presents analytical and numerical techniques for analyzing the scattering from a planar equiangular spiral antenna loaded at its terminals. The scattering matrix for the loaded antenna is derived as a function of the antenna load impedance. This derivation is the result of an analytical study of the voltage/current relationship at the antenna terminals along with an application of a multiport analysis of the scattering problem. A numerical technique is also developed that utilizes at different wavelengths common elements of the generalized impedance matrix of the moment method solution. This technique provides for rapid computation of the scattering properties of the spiral antenna across a band of frequencies. Author (GRA)

A KERNEL DECISION SUPPORT SYSTEM FOR CANADIAN MILITARY SATELLITE COMMUNICATIONS SYSTEM PLANNING M.S. Thesis
James R. Leitch Dec. 1985 148 p
(AD-A167122; AFIT/GSO/ENS/85D-11) Avail: NTIS HC A07/MF A01 CSCL 17/2

The kernel requirements for a DSS to plan technically feasible SATCOM systems is developed. The literature review focuses on understanding the decision process and a search for a suitable analytic tool for SATCOM system design. A model of the decision process is developed. The model is found to be a semi-structured task as the management control level. The process involves independent and interdependent decisions at all levels of management. The decision process contains elements of the rational, satisfying, organizational procedures, political and individual differences perspectives of decision making. Link analyses is developed as the analytic tool to support the decision process. The initial equation is developed and the effects of multiple users and multiple access are added. Link analysis provides a straight forward method of determining technical feasibility. A set of parameters for link analysis and the attendant equations are developed. The representations, operations, memory aids, and control mechanisms necessary to implement the kernel DSS are determined. Two linkages for future modules were identified: the Analytic Hierarchy Process as a module to determine the SATCOM user's evaluation criteria and a cost module. The research concludes that a DSS is well suited to the SATCOM planning process. GRA

While much development has been accomplished for reflector antenna technology, a need still exists in evaluating the impacts of design parameters. One such area is included in the design tradeoffs associated with the beam-scanning performance of reflector designs. A surface current integration analysis is derived which is exact to the order of physical optics. This analysis is applied to both circular and offset reflectors for on-axis and off-axis illumination for parameters which span the cases for which both substantial and minimal degradation with beam scan occur. The output of the analysis is cast in the form of contour plots defining the field structure in the focal region of the reflector. The results of the analyses compare favorably with data previously obtained for specialized parameters. GRA

(AD-A167560; NOSC/TD-866) Avail: NTIS HC A02/MF A01 CSCL 09/5

Recently a computer program, MININEC, has become available that can be used to calculate antenna characteristics, including the actual current distribution on the array elements. This program is generally available and can run on various microcomputers. A design procedure for broadcast array antennas has been developed which uses this computer program to calculate antenna characteristics for a specified array geometry. These results are then used by a separate routine that optimizes the excitation voltages, by gradient search, in order to achieve, as nearly as possible, a specified pattern. GRA

This quarter, we have generalized the TDFD RCS code to handle materials characterized by: (1) Lossy, frequency-dependent dielectrics, (2) Magnetic loss and conductivity, (3) Anisotropy in the xy plane, and (4) Embedded resistive or reactive sheets. Our treatment of frequency dependence goes beyond what had been the state of the art in TDFD codes; the frequency dependence here may be anisotropic and may extend across a molecular resonance. The techniques for doing this are documented in the attached article, Time-domain treatment of Maxwell's equations in frequency dependent media. This article was written for the March conference in Monterey and represents work entirely inspired by the present contract. GRA

(Contract W-7405-eng-48)
(DE86-009619; UCID-20616) Avail: NTIS HC A02/MF A01

The passage of long, high-power microwave pulses in the atmosphere was studied using a one-dimensional computer code. The objective of this study was to obtain a time history of the electron conductivity and peak density, as well as the peak plasma density. The results are summarized as follows: (1) the threshold level depends on pulse frequency and length; (2) electron avalanche occurs only when the pulse intensity exceeds the threshold level for air break-down, and this results in tail erosion; (3) for higher pulse intensities, it requires less time to initiate electron avalanche, which results in transmitting smaller portions of the pulse; (4) the general characteristics of the electron density, conductivity, and plasma frequency are quite similar for both cases; and (5) as the pulse amplitude rises, the electron conductivity and density and the plasma frequency also rise. DOE

N86-31772# Lawrence Livermore National Lab., Calif.
SIG: A GENERAL-PURPOSE SIGNAL PROCESSING PROGRAM
D. Lager and S. Azevedo Feb. 1986 6 p Presented at the Institute for Electrical and Electronics Engineers International Conference on Circuits and Systems, San Jose, Calif., 5 May 1986
(Contract W-7405-eng-48)
(DE86-009725; UCRL-94111; CONF-860589-2) Avail: NTIS HC A02/MF A01

SIG is a general-purpose signal processing, analysis, and display program. Its main purpose is to perform manipulations on time- and frequency-domain signals. It also accommodates other representations for data such as transfer function polynomials. Signal processing operations include digital filtering, auto/cross spectral density, transfer function/impulse response, convolution, Fourier transform, and inverse Fourier transform. Graphical operations provide display of signals and spectra, including plotting, cursor zoom, families of curves, and multiple viewport plots. SIG provides two user interfaces with a menu mode for occasional users and a command mode for more experienced users. Capability exits for multiple commands per line, command files with arguments, commenting lines, defining commands, automatic execution for each item in a repeat sequence, etc. SIG is presently available for VAX(VMS), VAX (BERKELEY 4.2 UNIX), SUN (BERKELEY 4.2 UNIX), DEC-20 (TOPS-20), LSI-11/23 (TSX), and DEC PRO 350 (TSX). COMPARISON OF CLIFFORD AND GRASSMANN ALGEBRAS IN APPLICATIONS TO ELECTROMAGNETICS, REVISION 1
G. A. Deschamps and R. W. Ziolkowski Feb. 1986 17 p Presented at the Advanced Research Workshop: Clifford Algebras and Their Applications To Mathematical Physics, Canterbury, England, 15 Sep. 1985 Prepared in cooperation with Lawrence Livermore National Lab., Calif.
(Contract W-7405-eng-48)
(DE86-009716; UCRL-92562-Rev-1; CONF-8509246-1-Rev-1) Avail: NTIS HC A02/MF A01

Grassmann and Clifford algebras are compared as to their applications to electromagnetics. The Grassmann algebra applies directly to (exterior) differential forms leading to Cartan's calculus. Forms of various degrees correspond most naturally to electromagnetic quantities and their relations are expressed by means of the exterior differential operator d. These relations are conveniently represented either in space or space-time by flow diagrams. They reveal the existence of potentials (Poincare's Lemma), the independence from coordinate systems, and the role of the metric. All of these properties are briefly reviewed. A calculus for functions having their values in a Clifford algebra can also be developed based on the Dirac operator D, whose square is a generalized Laplacian. Besides its role in Dirac's theory of the electron, this Clifford calculus can also be adapted to electromagnetics, although less directly than with Cartan's calculus. The point of departure is the role of a metric in a Clifford algebra. This can be remedied by introducing the Hodge star operator in the Grassmann algebra, an operation that is needed to express the property of matter usually represented by means of epsilon and (MU). DOE

SAPIENS MEMO 11. ELECTROMAGNETIC CHARACTERISTICS OF THE CONICAL TRANSMISSION-LINE EMP SIMULATOR SAPIENS
Sven Garmland Feb. 1986 53 p
(FOA-C-30415-A3; ISSN-0347-3708; ESA-86-97240) Avail: NTIS HC A04/MF A01; Research Inst. of National Defense, Stockholm, Sweden

A bounded wave electromagnetic pulse simulator was tested. Electric field measurements reveal deviations from an ideal curve shape. The largest deviation is traced to the termination of the simulator antenna. High-frequency components radiate through the termination and low-frequency ones are terminated by a resistive load. The space in between, where the wavelength is equal to the dimension of the termination, presents difficulties. Here, the inductance of the termination is crucial. By increasing the diameter of the wires connecting the resistors of the termination, the inductance may be reduced. It is shown how TEM-reflections from the termination can be diminished from 10% to 2% by replacing the wires with cylinders made of chicken-wire. The electric and the magnetic fields measured inside and outside the simulator confirm the good qualities of the simulator design regarding the antenna bandwidth, the field impedance, homogeneity, and polarization. AUTOMATIC SPEECH RECOGNITION FOR LARGE VOCABULARIES Final Report, Dec. 1984
Abdulmesih Aktas, Bernhard Kaemmerer, Wolfgang Kuepper, and Helmut Lagger Bonn, West Germany BMFT Dec. 1985 128 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-DV-85-003; ISSN-0170-9011; ESA-86-97434) Avail: NTIS HC A07/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 27

An isolated word recognition system for large vocabularies (1000 to 5000 words) with 98% recognition performance was developed. It was implemented on an array processor for real time requirements. The speech signal is described by short time autocorrelation functions. Short response times as well as high recognition accuracies are achieved by means of a hierarchical classification scheme. A fast preselection stage yields a small number of suitable word candidates to be considered for further classification. To that end a linear segmentation or a segmentation based on acoustic or phonetic cues was performed. High selectivity is obtained by using fine temporal resolution and nonlinear time alignment in the final classification step. By taking into account phonetically identical fragments of words, a distinction between highly confusable words can be made. Speaker adaptation for new system users is performed within a relatively short training phase. ESA

TIME SYNCHRONIZATION VIA SYMPHONIE HIGH ACCURACY LOW COST (HALO) Final Report, Nov. 1983
Hans-Martin Sylwasschy Bonn, West Germany Bundesministerium fuer Forschung und Technologie Dec. 1985 71 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-021; ISSN-0170-1339; ESA-86-97465) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 15

The High Accuracy-Low cost (HALO) sidetone method, a modulation emitter, and a demodulation receiver were developed to meet accuracy and narrow band width requirements. The functional principle of HALO is described. Field measurements were performed with one modem and time comparative measurements with the two HALO modems. Compact arrangement, simple control of the station periods, and optimization of time signals regarding emission efficiency and band width are required. The HALO is an interface between comparative normal and link signals and produces an HF transfer signal from the comparative normal signals. The accuracy of 1 ns for time synchronization can be improved. The components developed for HALO can be applied to phase-sensitive systems. ESA

TRAVELING WAVES IN A ONE-DIMENSIONAL CHAIN WITH NONHARMONIC RECIPROCITY [LOPENDE GOLVEN IN EEN-DIMENSIONALE KETEN MET NIET-HARMONISCHE WISSELWERKING]
J. H. Wortel Jun. 1984 114 p In DUTCH
(ESA-86-97379) Avail: NTIS HC A06/MF A01

Traveling waves in a one-dimensional Lennard-Jones chain were studied by resolving a variance problem numerically. By integrating the motion equation numerically, the apporach was improved using the Poincare surface of section. Deviations were interpreted with the Floquet theory. Calculations were carried out for 3 and 12 particles. Up to a certain energy the waves are linearly stable; above this level they are linearly unstable (for three particles). ESA

ANALYSIS OF A COMBINED FMCW PULSE RADAR SYSTEM FOR SIDE LOOKING AIRBORNE RADAR (SLAR) APPLICATIONS [ANALYSE VAN EEN GECOMBINEERD FMCW-PULS RADAR SYSTEEM VOOR SLAR TOEPASSINGEN]
Roger Timmerman Jan. 1985 79 p In DUTCH; ENGLISH summary
(Rept-05-1-533-A106-85; ESA-86-97707) Avail: NTIS

HC A05/MF A01

A theoretical and practical feasibility study for the development of an FMCW radar, combining features of FMCW and pulse radars was performed for application as SLAR for Earth observation. Design approaches were compared. Simulations with a network analyzer and an intermediate frequency system are presented. The simulation results are similar to a FMCW processed radar signal. A method to simulate the radar system at microwave frequencies is discussed. A block diagram of the final system is given. Noise behavior and transmitter power are discussed. ESA

ADAPTIVE CONTROL OF THE ALOHA PROTOCOL IN A MOBILE RADIO CELLULAR SYSTEM Ph.D. Thesis [CONTROLE ADAPTATIF DU PROTOCOLE ALOHA DANS UN SYSTEME RADIOMOBILE CELLULAIRE]
Rasoamihamina RazananoelyRejo Jul. 1985 105 p In FRENCH
(ENST-85E013; ISSN-0751-1353; ESA-86-97634) Avail: NTIS HC A06/MF A01

Simple retransmission strategies are adopted to allow for the utilization of the ALOHA synchronous random access protocol. Numerical simulations were performed using a model representing the set of mobiles and the base station of a cell. The main propagation problems are progressively incorporated in the simulation, showing that the adaptive policy is always the best. Controlled ALOHA and a traditional protocol such as AMRT are compared, defining for each case the limiting rate below which the proposed system is preferable. ESA

OPTICAL FIBER TRANSMISSION ON SATELLITES AND ORBITAL STATIONS
C. Lopez and J. M. Nakache 1986 7 p
(SNIAS-861-440-108; ESA-86-97616) Avail: NTIS HC A02/MF A01

The possibilities and advantages offered by optical fiber transmission are explored. The analysis includes performance requirements, candidate link solutions, and laboratory implementation. The results of experiments carried out in laboratory are given, including behavior under radiated electromagnetic disturbances, comparison of detection device efficiencies, transmission of CCD video signals, and high rate digital transmission by optical slip ring. The laboratory experiments show compatibility of achieved performances with future needs. ESA

VULNERABILITY OF LOW REDUNDANCY IMAGE DATA AND TEXT TRANSMISSION OVER SATELLITE COMMUNICATION LINKS Final Report
H. J. Simons Paris ESA 10 Jul. 1985 76 p
(Contract ESTEC-6235/85-NL-JS)
(NLR-TR-85100-L; ESA-CR(P)-2185; ESA-86-97785) Avail: NTIS HC A05/MF A01

The effect of transmission errors on satellite communication links on uncompressed and compressed Earth observation image data and on compressed facsimile data are described. The error statistics on the ECS/SMS channel are studied. Because of the high level data link control transmission protocol, several types of errors are introduced. The effects of these errors on user data are evaluated qualitatively and quantitatively. ESA

LONGTERM SPEECH SPECTRA OF NONSTATIONARY AUTOREGRESSIVE MODELS
Giuseppe Martinelli, Gianni Orlandi, and Lucio PrinaRicotti Jun. 1985 7 p
(FUB-8-1985; ESA-86-97884) Avail: NTIS HC A02/MF A01

Long term time-frequency spectra of words were obtained using autoregressive methods to characterize complete words without segmentation. The resulting spectra and the time dependent coefficients of the AR filter are compared with the short term stationary case. Examples show a better accuracy given by discussed method, in spite of the reduced number of parameters involved in the proposed representation. ESA

PHYSICAL SIGNIFICANCE OF LEAST MEAN SQUARES CRITERION IN NONSTATIONARY LATTICE PREDICTORS
Giuseppe Martinelli, Gianni Orlandi, Lucio PrinaRicotti, and Susanna Ragazzini Jun. 1985 10 p
(FUB-9-1985; ESA-86-97885) Avail: NTIS HC A02/MF A01

An acoustical nonstationary model of the vocal tract is discussed. The effectiveness of the nonstationary lattice predictor in recovering the model is illustrated. The reflection coefficients are linearly decomposed on a function basis and the weights of the linear combinations are the new parameters of the model. Parameters are determined by an algorithm similar to Burg's by minimizing the sum of the variances of the forward and backward residuals. Synthetic signals of good approximation are obtained in two examples. ESA

INTERCONNECTION BETWEEN PACKET SWITCHING NATIONAL NETWORKS AND LOCAL PACKET RADIO COMMUNICATION NETWORKS [INTERFUNZIONAMENTO RETE NAZIONALE A COMMUTAZIONE DI PACCHETTO E RETI DI RADIOCOMUNICAZIONE A PACCHETTO]
Paolo Talone and Sebastiano Trigila Jul. 1985 17 p In ITALIAN
Presented at 33rd Congresso Internazionale delle Comunicazioni, Genoa, Italy, Oct. 1985
(FUB-24-1985; ESA-86-97887) Avail: NTIS HC A02/MF A01

Multipoint topology networks based on a single statistically distributed radiocommunication channel are considered, referring only to restricted area networks with line of sight type links. The architecture and protocols of such networks are reviewed. The problems related to the interconnection of such networks with large public packet switching communication networks are examined. Several hypothesis are studied concluding that mainly in the case of emergencies or catastrophic events these networks are an extremely useful resource. ESA

THE EFFECT OF PIGTAILING BRAIDED SCREENS ON THE TRANSFER IMPEDANCE OF SINGLE-ENDED AND BALANCED INTERFACE CIRCUITS
J. W. E. Jones, C. J. Lines, and J. S. Jahns Jan. 1985 17 p
(EMCR-5/85; BR97103; ESA-86-97259) Avail: Issuing Activity

The effects of short pigtails on the transfer impedance of 1 m lengths of screened cables were measured. Comparisons with a simple theory of the effect of pigtails show reasonable agreement. Measurements on twin cables are included. Results show that pigtails reduce shielding effectiveness at higher frequencies. The frequency at which this deterioration sets in is a function of cable length, cable transfer impedance, and pigtail length and spacing. ESA

A SENSOR FAILURE SIMULATOR FOR CONTROL SYSTEM RELIABILITY STUDIES
Kevin J. Melcher, John C. Delaat, Walter C. Merrill, Lawrence G.

Oberle, Gerald G. Sadler, and Joseph H. Schaefer 1986 43 p (NASA-TM-87271; E-3137; NAS 1.15:87271) Avail: NTIS HC A03/MF A01 CSCL 09A

A real-time Sensor Failure Simulator (SFS) was designed and assembled for the Advanced Detection, Isolation, and Accommodation (ADIA) program. Various designs were considered. The design chosen features an IBM-PC/XT. The PC is used to drive analog circuitry for simulating sensor failures in real-time. A user defined scenario describes the failure simulation for each of the five incoming sensor signals. Capabilities exist for editing, saving, and retrieving the failure scenarios. The SFS has been tested closed-loop with the Controls Interface and Monitoring (CIM) unit, the ADiA control, and a real-time F100 hybrid simulation. From a productivity viewpoint, the menu driven user interface has proven to be efficient and easy to use. From a real-time viewpoint, the software controlling the simulation loop executes at greater than 100 cycles/sec. Author

SPACE SOLAR CELL RESEARCH: PROBLEMS AND POTENTIAL
Dennis J. Flood 1986 13 p Presented at the Conference on Photovoltaics for Commercial Solar Power, Cambridge, Mass., 15-19 Sep. 1986; sponsored by the Society of Photo-Optical Instrumentation Engineers
(NASA-TM-88833; E-3212; NAS 1.15:88833) Avail: NTIS HC A02/MF A01 CSCL 10A

The value of a passive, maintenance-free, renewable energy source was apparent in the early days of the space program, and the silicon solar cell was pressed into service. Efficiencies of those early space solar arrays were low, and lifetimes shorter than hoped for, but within a decade significant advances had been made in both areas. Better performance was achieved through improvements in silicon single crystal material, better device designs, and a better understanding of the factors that affect the performance of a solar cell in space. Chief among the latter, particularly for the mid-to-high altitude (HEO) and geosynchronous (GEO) orbits, are the effects of the naturally occurring particulate radiation environment. Although not as broadly important to the photovoltaic community at large as increased efficiency, the topic of radiation damage is critically important to use of solar cells in space, and is a major component of the NASA research program in space photovoltaics. A brief overview of some of the opportunities and challenges for space photovoltaic applications is given, and some of the current research directed at achieving high efficiency and controlling radiation damage in space solar cells is discussed. SELECTIVELY ETCHING MICROSTRUCTURES IN A GLOW DISCHARGE PLASMA Patent Application
Edward J. Staples, inventor (to Army) Filed 17 Mar. 1986 12 p (AD-D012206; US-Patent-Appl-SN-845671) Avail: NTIS HC A02/MF A01 CSCL 13/8

Selective etching of microelectronic devices comprising crystal substrates is achieved by electrically masking conductive areas thereon which are not to be etched by ionic bombardment. The electrical masking is accomplished by biasing the selected areas with a bias voltage which will repel the ions, which are attracted to all of the unbiased portions of the microelectronic device. APPARATUS AND METHOD FOR ALIGNING A MASK AND WAFER IN THE FABRICATION OF INTEGRATED CIRCUITS Patent
John F. Bass, Nelson Saks, and Martin Peckerar, inventors (to Navy) Issued 4 Feb. 1986 8 p Supersedes AD-D010595
(AD-D012208; US-Patent-Appl-SN-536125;
US-Patent-Class-356-401) Avail: US Patent and Trademark Office CSCL 20/12

An apparatus and method for aligning a mask and wafer in the fabrication of integrated circuits utilizing alignment patterns on the mask and wafer is discussed. Each alignment pattern comprises a plurality of parallel alignment marks which are spaced from one another such that the patterns may be superimposed so that the marks of one pattern are positioned between marks of the other pattern. When the patterns are misaligned, a moire pattern is produced which disappears on alignment. The marks of each pattern are also disparately spaced from one another, permitting a gross to fine alignment. In aligning the patterns, each mark of one pattern is positioned between pairs of marks of the other pattern in an order corresponding to the widths of spaces defined between marks of the other pattern, progressing from the largest space width, giving gross alignment, to the smallest, giving fine alignment. (Contract F04701-85-C-0086)
(AD-A167418; TR-0086(6925-08)-3; SD-TR-86-22) Avail: NTIS HC A02/MF A01 CSCL 09/1

Satellite electronics systems may function for years before failing as a result of a shorted-out component. If the insulation is considered to be perfectly inert, then such failures would be inexplicable in terms of events intrinsic to the material. However, many physical and chemical changes may occur in the dielectric prior to breakdown. Hence, a polymer dielectric is not inert and may be more accurately thought of as a seething molecular and electronic cauldron, which gradually drifts in the direction of diminished resistance to applied electrical stress. After a time, which appears indefinite only because we have not adequately characterized the system, the constant electrical stress shorts out the degraded insulation. A correlation between decreases in infrared absorbance, molecular motion, electronic energy transfer, and increasing susceptibility to electric stress is supported by the data presented here. It is suggested that the development of new, voltage-stabilized materials can be greatly facilitated by using Fourier transform infrared spectroscopy (FTIR) as a diagnostic tool, and thermal aging as an accelerated aging test. DESIGN AND COLD TESTING OF A HIGH PEAK POWER X-BAND GYROKLYSTRON
W. Lawson, J. Calame, V. L. Granatstein, P. E. Latham, J. McAdoo, G. S. Park, C. D. Striffler, F. J. Williams, K. R. Chu, and J. L. Seftor 1985 3 p Presented at the International Conference on Infrared and Millimeter Waves, Lake Buena Vista, Fla., 8 Dec. 1985 Prepared in cooperation with Science Applications International Corp., McLean, Va.
(Contract DE-AC05-85ER-40216)
(DE86-006898; CONF-851238-5) Avail: NTIS HC A02/MF A01

The main goal of the University of Maryland's gyroklystron project is to develop an efficient, high power, high gain, phase controllable amplifier at 10 GHz. While peak powers of several hundred megawatts are ultimately of interest, our initial experimental design values include 30 MW of output power in 1 microsec pulses with a gain in excess of 50 dB. The 30 MW power level represents an enhancement of almost three orders of magnitude over the current state-of-the-art in gyroklystron amplifiers. This enhancement will be achieved by going to high beam energies (gamma approx. =2) and overmoded cavities (TE sup o sub 01). Outlined in this report are the steps being taken to realize this goal. DOE

N86-31800# Sandia National Labs., Albuquerque, N. Mex.
ACCESSIBILITY OF APPLICATIONS SPECIFIC INTEGRATED CIRCUITS
D. R. Strip Mar. 1986 16 p
(Contract DE-AC04-76DP-00789)
(DE86-009561; SAND-86-0514) Avail: NTIS HC A02/MF A01

Applications specific integrated circuits (ASICs) open new design opportunities in Sandia component applications. ASICs can be used to overcome many of the constraints that reduce system functionality in Sandia systems. Key constraints in our environment are power consumption, volume, weight, speed, and radiation-hardness. In addition, use of ASICs may reduce the costs of system design, acquisition, and life-cycle maintenance. Design tools for integrated circuits are rapidly simplifying the design of integrated circuits. Just as high level computer languages enabled applications-oriented computer users to take control of their own code development after assembly coding had limited the practicality of user design, in ICC design tools and approaches are enabling the applications-oriented user to design an ASIC with modest training and in a short time period. In order to demonstrate the state of the design systems, we have selected a representative application and, without any formal training or experience in IC design, have designed and fabricated an ASIC. This report details the steps that were followed and the time they took. It is important to emphasize that this project was the first chip designed start-to-finish on the Mentor design stations in Organization 2110; therefore most of the problems encountered were typical of a first pass through a new system. Most of the problems were quickly wrung out by the CAD tools staff; future users of the system should not expect to have the problems recur. DOE

LIGHT EMISSION FROM METAL-INSULATOR-METAL STRUCTURES BIASED NEAR BREAKDOWN VOLTAGES
M. J. Bloemer, J. P. Goudonnet, D. R. James, R. J. Warmack, T. L. Ferrell, E. T. Arakawa, and T. A. Callcott 1986 4 p Presented at the International Symposium on Electrical Insulation, Washington, D.C., 8 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008505; CONF-860693-1) Avail: NTIS HC A02/MF A01

Optical emission is observed at prebreakdown voltages in thin film metal-insulator-metal (MIM) structures. Subsequent examination of the junction in a scanning electron microscope (SEM) reveals filamentary growth through the insulator. These tunnel junctions consist of Al-Al2O3-Ag or Al-Al2O3-Au with a variety of microstructures incorporated in the junction. The emission spectrum is found to be dependent on the geometry of the MIM structure. Comparison of theory and experiment suggests the emission results from the radiative decay of collective electronic excitations (surface plasmons) initiated by electrons tunneling through the insulator. DOE

CHARACTERIZATION OF THE REDOX BEHAVIOR AND STABILITY OF CONDUCTING OXIDES
H. U. Anderson, S. A. Howard, and D. M. Sparlin Jan. 1986 164 p
(Contract DE-FG02-85ER-45219)
(DE86-009871; DOE/ER-45219/T1) Avail: NTIS HC A08/MF A01

The goal of this study was to examine the relation between electrical conductivity, oxidation-reduction kinetics, defect structure, and composition of n- and p-type binary and ternary transition metal oxides. The experimental part included, thermogravimetry, X-ray diffraction, thermally stimulated current, oxygen diffusion, optical absorption, transmission electron microscopy, electrical conductivity, and Seebeck measurements. The oxide systems studied were La-doped SrTiO3, Mg-doped LaCrO3, Mg-doped LaMnO3, Sr-doped LaMnO3, and Nb-doped LaCrO3. Results show that at low oxygen activity donor doped LaCrO3 is n-type but becomes p-type as oxidation occurs; substitution of 50% Mn into LaCrO3 enables the compound to be sintered to high density in air at 1500 C; LaMnO3 tends to decompose as reduction occurs with Mg-doped LaMnO3 being more stable than Sr-doped LaMnO3; LaMnO3 decreases its conductivity at oxygen activities 10 to the third power to 10 to the fifth power times higher than for LaCrO3; and upon reduction Mg and Sr-doped LaCrO3 expands about 0.04% and 0.4% respectively. DOE

ELECTRON-BEAM PROGRAMMABLE CONFIGURATION CIRCUITS Final Report, Sep. 1984
Reinhard Brock and Ulrich Theus Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 55 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-163; ISSN-0340-7606; ESA-86-97442) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 11.50

The feasibility of direct-write electron beam lithographic systems for wafer scale integration was investigated. Electron-beam induced conductivity of silicon dioxide can be used to charge polysilicon floating gates in integrated circuits; a high programming voltage on the chip is not required. The information stored as a charge is nonvolatile and can be used to activate spare modules during a configuration process of a wafer scale system. Direct-write electron beam exposure systems are most suited for this programming. Electron-beam programmable cells were designed using a standard polygate CMOS-process. ESA

A NEW MODEL FOR THE RELATION BETWEEN CONDUCTIVITY AND CURRENT IN AN MHD GENERATOR [EEN NIEUW MODEL VOOR HET VERBAND TUSSEN HET GELEIDINGSVERMOGEN EN DE STROOM IN EEN MHD GENERATOR]
J. C. W. Sars Nov. 1984 117 p In DUTCH
(EG/84/373; ESA-86-97527) Avail: NTIS HC A06/MF A01

A model for the calculation of the induced current in an MHD generator was derived. Starting from voltage probe measurements, relations between conductivity and current, and voltage drop and current were derived and inserted in the Kirchhof law. For certain values of velocity, the magnetic field, and the load resistance, the impossibility of a certain segment to conduct current despite an induced voltage greater than 0 is predicted. The whole voltage falls over the internal resistance. The whole generator channel in X-direction was calculated with a correction for the Hall Short Circuit (HSC), measured and calculated values agree well. The HSC also explains the current reduction in the second half of the generator. ESA

A 2 MBIT/SEC MODEM AT 70 MHz BASED ON THE TAMED FREQUENCY MODULATION (TFM) PRINCIPLE [EEN 2 MBIT/S MODEM OP 70 MHLCZ VOLGENS HET TAMED FREQUENCY MODULATION PRINCIPLE]
M. J. Verhaegh May 1984 102 p In DUTCH
(ESA-86-97537) Avail: NTIS HC A06/MF A01

A tamed frequency modulation (TFM) digital phase modulation method modem was designed and realized for satellite communication experiments. The method offers possibilities for bandwidth and power efficiency, and the use of nonlinear amplifiers, which makes it apt for satellite and mobile radio communication. Normal and coherent quadrature modulators are described. The carrier wave regain, necessary for coherent detection, is achieved with a heterodyne phase locked loop. Measured bit error rate as a function of the signal to noise ratio is given. ESA

EXPERIMENTAL AND THEORETICAL RESEARCH ON OPEN RESONATORS
Erich Kemptner Nov. 1985 134 p Original language document was announced as N85-31414
(ESA-TT-931; DFVLR-FB-85-12; ESA-86-97574) Avail: NTIS HC A07/MF A01; original German version available from DFVLR, Cologne, West Germany DM 35.50

The scalar integral equations for open resonators are derived. The complex eigenvalue determines power loss and phase shift per transit. The eigenfunction represents the field distribution on a reflector. This distribution is used to calculate the field inside the resonant volume. An experimental setup to measure the resonant frequencies and the quality factors was designed. The field was scanned with small spheres. The quality, the resonant frequency and the amplitude of the signal were recorded simultaneously. Data agree with the theoretical ones. ESA

N86-31817# European Space Agency, Paris (France).
DIRECT-COUPLED CAVITY FILTERS WITH IRISES OF ARBITRARY THICKNESS
Manfred Weisser and Karl Hans Waegel Oct. 1985 69 p Original language document was announced as N86-10412
(ESA-TT-939; DFVLR-FB-85-14; ESA-86-97576) Avail: NTIS HC A04/MF A01; original German version available from DFVLR, Cologne, West Germany DM 21

The transmission characteristics of symmetrical waveguide filters were investigated. The thickness of the irises is taken into account. The calculations are based on an exact mode matching method. In the frequency range of the X-band one, two, three, four, and six-cavity filters are analyzed and parameters such as aperture, thickness of irises, and cavity length are changed. The results of the measurements are in good agreement with the computed transmission characteristics. ESA

FLOOR PLANNING AND NET ASSIGNMENT IN LAYOUT COMPILATION
Lukas vanGinneken 18 Mar. 1985 35 p
(ESA-86-97530) Avail: NTIS HC A03/MF A01

The layout design of a silicon compiler is reviewed. The environment in terms of input, output and data bases is discussed. A complete design process is outlined and interpretated as an application of the principles of stepwise refinement to the design of complex integrated circuits. The rationale behind the chosen system decomposition, accepted restraints, and methods for cell assembling is emphasized. An annealing algorithm is summarized. The use of the algorithm for floor plan design, used state spaces and moves, and the way the score function is computed are described. An automatic control schedule is described. A method for the global wiring of custom layout of ICs is given. ESA

MULTIPLE PSEUDOSPARK SWITCH (MUPS) [MULTI-PSEUDOFUNKENSCHALTER (MUPS)]
G. Mechtersheimer and R. Kohler 28 Jun. 1986 14 p In GERMAN
(ISL-R-110/85; ESA-86-97624) Avail: NTIS HC A02/MF A01

A multiple pseudospark commutator was developed. Several pseudospark gaps in parallel can be synchronously ignited via triggering by a pulsed gaseous discharge with low intensity. A multiple pseudospark commutator consisting of 10 linearly disposed pseudospark gaps was integrated in a capacitor with low-inductance plates. The capacitance to be switched was 5 nF; the inductance of the circuit was 1.65 nH, the contribution of the MUPS was less than 0.5 nH. The repartition of the current among the 10 discharge channels allows a current increase rate of 2.4 times 10 to the 12th power A/s at a switched voltage of 15 kV. This is a significant improvement compared to the value of 5 times 10 to the 11th power A/s obtained with a single pseudospark gap. The current capacity of the switch increases with the number of pseudospark gaps ignited in parallel. ESA

A CONSERVATIVE RATING PROCEDURE FOR CYCLICALLY LOADED, BURIED CABLES
G. Koopmans and A. J. vanLoon, ed. 1985 10 p
(S/T-Rept-Vol-3-No-9; ISBN-90-353-0032-7; ISSN-0167-8590; B8665325; ESA-86-98063) Avail: NTIS HC A02/MF A01

A conservative and simple current-rating algorithm for buried power cables subjected to a cyclically varying load is presented. The algorithm is based on the assumption that the moisture distribution in the soil is stationary during load variations and that

it is determined by the spatial distribution of the maximum heat flux. This assumption is reasonable in view of the hysteretic nature of moisture retention by soils. Only one Fourier component of the heat-loss variation is considered in the algorithm. Applications where adapted equations of Philip and De Vries are used to describe heat and moisture transfer are shown. The critical temperatures found for drying-out of the soil hardly differ for stationary and cyclic loads. The maximum allowed average load decreases with increasing load variation. At maximum load, the maximum current occurring during a cycle is higher than the maximum stationary load allowed. ESA

NUMERICAL SIMULATION OF BOUNDARY LAYERS. PART 2: RIBBON-INDUCED TRANSITION IN BLASIUS FLOW
Philippe Spalart and Kyung-Soo Yang (Stanford Univ., Calif.) Feb. 1986 27 p
(NASA-TM-88221; A-86072; NAS 1.15:88221) Avail: NTIS HC A03/MF A01 CSCL 20D

The early three-dimensional stages of transition in Blasius boundary layers are studied by numerical solution of the Navier-Stokes equations. A finite-amplitude two-dimensional wave and random low-amplitude three-dimensional disturbances are introduced. Rapid amplification of the three-dimensional components is observed and leads to transition. For intermediate amplitudes of the two-dimensional wave the breakdown is of subharmonic type, and the dominant spanwise wave number increases with the amplitude. For high amplitudes the energy of the fundamental mode is comparable to the energy of the subharmonic mode, but never dominates it; the breakdown is of mixed type. Visualizations, energy histories, and spectra are presented. The sensitivity of the results to various physical and numerical parameters is studied. Agreement with experimental and theoretical results is discussed. Author

A 3-COMPONENT LASER-DOPPLER VELOCIMETER DATA ACQUISITION AND REDUCTION SYSTEM
L. C. Rodman, J. H. Bell, and R. D. Mehta Jan. 1986 82 p
(Contract NCC2-294)
(NASA-CR-177390; NAS 1.26:177390) Avail: NTIS HC A05/MF A01 CSCL 20D

This report describes a laser Doppler velocimeter capable of measuring all three components of velocity simultaneously in low-speed flows. All the mean velocities, Reynolds stresses, and higher-order products can then be evaluated. The approach followed is to split one of the colors used in a 2-D system, thus creating a third set of beams which is then focused in the flow from an off-axis direction. The third velocity component is computed from the known geometry of the system. In this report, the laser optical hardware and the data acquisition electronics are described in detail. In addition, full operating procedures and listings of the software (written in BASIC and assembly languages) are also included. Some typical measurements obtained with this system in a vortex/mixing layer interaction are presented and compared directly to those obtained with a cross-wire system. Author

CALCULATIONS OF THE STABILITY OF SOME AXISYMMETRIC FLOWS PROPOSED AS A MODEL OF VORTEX BREAKDOWN Final Report
Nessan Mac Giolla Mhuiris May 1986 37 p Submitted for publication
(NASA-CR-178124; NAS 1.26:178124; ICASE-86-34) Avail: NTIS HC A03/MF A01 CSCL 20D

The term vortex breakdown refers to the abrupt and drastic changes of structure that can sometimes occur in swirling flows. It was conjectured that the bubble type of breakdown can be viewed as an axisymmetric wave traveling upstream in a primarily columnar vortex flow. In this scenario the wave's upstream progress is impeded only when it reaches a critical amplitude and it loses stability to some nonaxisymmetric disturbance. The stability of some axisymmetric wavy flows to three dimensional disturbances, viewing the amplitude of the wave as a bifurcation parameter is examined. The stability of a set of related columnar vortex flows, constructed by taking the two dimensional flow at a single axial location and extending it throughout the domain without variation, is investigated. The method used will be to expand the perturbation velocity in a series of divergence free vectors which ensures that the continuity equation for the incompressible fluid is satisfied exactly by the computed velocity field. Projections of the stability equation onto the space of inviscid vector fields eliminated the pressure term from the equation and reduces the differential eigen problem to a generalized matrix eigen problem. Results are presented both for the one dimensional, columnar vortex flows and also for the wavy bubble flow. Author

MODELING OF ZERO GRAVITY VENTING: STUDIES OF TWO-PHASE HEAT TRANSFER UNDER REDUCED GRAVITY Final Report
Herman Merte, Jr. Aug. 1986 66 p
(Grant NAG3-403)
(NASA-CR-179662; NAS 1.26:179662) Avail: NTIS HC A04/MF A01 CSCL 20D

The objective is to predict the pressure response of a saturated liquid-vapor system when undergoing a venting or depressurization process in zero gravity at low vent rates. An experimental investigation of the venting of cylindrical containers partially filled with initially saturated liquids was previously conducted under zero-gravity conditions and compared with an analytical model which incorporated the effect of interfacial mass transfer on the ullage pressure response during venting. A new model is presented to improve the estimation of the interfacial mass transfer. Duhammel's superposition integral is incorporated to approximate the transient temperature response of the interface, treating the liquid as a semi-infinite solid with conduction heat transfer. Account is also taken of the condensation taking place within the bulk of a saturated vapor as isentropic expansion takes place. Computational results are presented for the venting of R-11 from a given vessel and initial state for five different venting rates over a period of three seconds, and compared to prior NASA experiments. An improvement in the prediction of the final pressure takes place, but is still considerably below the measurements. Author

HIGH SPEED VISCOUS FLOW CALCULATIONS ABOUT COMPLEX CONFIGURATIONS

Denny S. Chaussee Apr. 1986 21 p
(NASA-TM-88237; A-86199; NAS 1.15:88237) Avail: NTIS HC A02/MF A01 CSCL 20D

Applications of the NASA Ames Parabolized Navier-Stokes (PNS) code to a variety of complex generic configurations is presented. The algorithm, boundary conditions, initial conditions, and grid generators are discussed as applied to these configurations. The PNS code was used as the mainline procedure to numerically simulate the viscous supersonic flow over these generic configurations. The turbulence model that was used in this study is the Baldwin-Lomax model. The boundary conditions are the usual viscous no slip at the wall, and a characteristic procedure is used to fit the bow shock wave which is the outermost boundary. An elliptic grid generator is employed to discretize the flow domain. In addition, an equilibrium air capability has been incorporated into the code. It uses the curve fits of Tannehill, et al. The flow regimes vary from a Mach number of 2 up to 25. Both laminar and turbulent flow are considered. Varying angles of attack have also been computed. Configurations vary from simple cone-type bodies to lifting winged bodies, such as the space shuttle or the generic supersonic cruise fighter. Author

NUMERICAL QUADRATURE METHODS FOR INTEGRALS OF SINGULAR PERIODIC FUNCTIONS AND THEIR APPLICATION TO SINGULAR AND WEAKLY SINGULAR INTEGRAL EQUATIONS Final Report
Avram Sidi (Technion - Israel Inst. of Tech., Haifa) and Moshe Israeli Jul. 1986 36 p Submitted for publication
(Contract NAS1-17070)
(NASA-CR-178151; ICASE-86-50; NAS 1.26:178151) Avail: NTIS HC A03/MF A01 CSCL 20D

High accuracy numerical quadrature methods for integrals of singular periodic functions are proposed. These methods are based on the appropriate Euler-Maclaurin expansions of trapezoidal rule approximations and their extrapolations. They are used to obtain accurate quadrature methods for the solution of singular and weakly singular Fredholm integral equations. Such periodic equations are used in the solution of planar elliptic boundary value problems, elasticity, potential theory, conformal mapping, boundary element methods, free surface flows, etc. The use of the quadrature methods is demonstrated with numerical examples. INFLOW BOUNDARY CONDITIONS FOR STEADY FLOWS OF VISCOELASTIC FLUIDS WITH DIFFERENTIAL CONSTITUTIVE LAWS Technical Summary Report
Michael Renardy Feb. 1986 10 p
(Contract DAAG29-80-C-0041; Grant NSF DMS-84-51761)
(AD-A167452; MRC-TSR-2916) Avail: NTIS HC A02/MF A01 CSCL 20/4

Steady flows of viscoelastic fluids can not be uniquely determined by imposing boundary conditions only for the velocities as in the Newtonian case. The reason for this is that the fluids have memory, and therefore the flow inside the domain is affected by what happened before the fluid entered the domain. This leads to the need for extra boundary conditions at an inflow boundary. The nature of these inflow boundary conditions has not been analyzed previously, and it is certainly dependent on the constitutive law. In this paper, we look at the special case of differential constitutive relations with a single relaxation mode. We consider steady transverse flows across a strip which are small perturbations of a flow with constant velocity. It turns out that in this case two extra inflow boundary conditions are required in two dimensions, and four in three dimensions. This is what would be expected from an analysis of characteristics, but it contradicts the belief of many rheologists that it is possible to prescribe the extra stress at an inflow boundary. The problem studied here is of potential relevance for numerical simulations of steady flows. Many of the flows currently simulated are on infinite domains. Numerically, these domains are truncated, and on the inflow boundary of the truncated domain people usually prescribe the extra stress. According to the analysis in this paper, this is an overdetermined problem, and therefore errors must be expected from this procedure. GRA

A FREE STREAMLINE MODEL FOR A RISING BUBBLE Summary Report
Jean-Marc Vanden-Broeck Mar. 1986 19 p
(Contract DAAG29-80-C-0041; Grant NSF MCS-80-01960)
(AD-A167535; MRC-TSR-2921) Avail: NTIS HC A02/MF A01 CSCL 20/4

The motion of a two dimensional bubble rising at a constant velocity in an unbounded fluid is solved by series truncation. It is assumed there is a wake of stagnant liquid extending to infinity below the bubble. Both the effects of gravity g and surface tension T are taken into account. It is shown that the problem is characterized by a continuum of solutions for T = 0 and by a discrete set of solutions when T is greater than 0. In addition a unique solution is obtained in the limit as the surface tension approaches zero. The corresponding profile of the bubble is found to be in good agreement with experimental data. The present paper describes example of such flow. Consider the motion of a two dimensional bubble rising at a constant velocity in an unbounded fluid. It is assumed there is a wake of stagnant liquid extending to infinity below the bubble. Both the effects of gravity and surface tension are taken into account. It is found that this problem is also characterized by a continuum of solutions when surface tension is neglected and by a discrete set of solutions when surface tension is taken into account. Moreover it is shown that a unique solution is obtained in the limit as the surface tension tends to zero. The corresponding profile of the bubble is found to be in good agreement with experimental data. GRA

SOLITARY AND PERIODIC WAVES IN SWIRLING FLOW Summary Report
Scott A. Markel Mar. 1986 30 p
(Contract DAAG29-80-C-0041)
(AD-A167538; MRC-TSR-2922) Avail: NTIS HC A03/MF A01 CSCL 20/4

The study of vortex breakdown gives rise to an interest in waves in swirling flow. Our interest is centered on the existence of both solitary and periodic internal waves. In this report a model physical problem is studied in a mathematically exact formulation.

We restrict our attention to an incompressible, inviscid fluid swirling through a right cylinder of infinite length and finite radius. Our theory, which is not restricted to small amplitudes, predicts both waves of elevation and depression, depending on the angular velocity (swirl) distribution and the velocity distribution at infinity. Just as for the classical surface solitary waves, these internal solitary waves are single crested, symmetric, and decay exponentially away from the crest. Hence they represent disturbances of essentially finite extent. Variational techniques and the theory of rearrangements are used to demonstrate these qualitative features. Moreover, we show that the solitary internal wave arises as a limit of periodic internal waves of increasing wave lengths. Variational techniques are used to demonstrate that the Euler equations possess solutions that represent progressing waves of permanent form. Moreover, internal solitary wave solutions are shown to arise as the limiting forms of internal periodic waves as the period length becomes unbounded. GRA

EFFECTS OF VARIABLE PROPERTIES IN FILM COOLED TURBULENT BOUNDARY LAYERS M.S. Thesis
Alfred F. Walz, Jr. Mar. 1986 76 p
(AD-A167716) Avail: NTIS HC A05/MF A01 CSCL 20/4

The effects of variable properties on heat transfer in a film-cooled turbulent boundary layer were investigated. A new procedure was developed to deduce adiabatic effectiveness from heat transfer coefficients based on the wall to freestream temperature difference, where both are representative of variable property flow conditions. The new technique was shown to be valid using data from the literature for injection into a turbulent boundary layer from one and two rows of injection holes. From these results, the variation of the coolant to mainstream density ratio was shown to have a significantly greater effect on heat transfer than variations of viscosity and thermal conductivity. FORMULATION OF NUMERICAL METHODS USED IN THE XYZ THREE-DIMENSIONAL POTENTIAL FLOW PROGRAM M.S. Thesis
William J. Beary, Jr. May 1986 96 p
(Contract N00228-85-G-3303)
(AD-A168167) Avail: NTIS HC A05/MF A01 CSCL 20/4

The calculation of non-lifting potential flow about arbitrary three dimensional bodies is examined in detail with specific interest in the XYZ Potential Flow program. The program uses a surface singularity distribution to solve the Neumann boundary value problem by means of a source panel method assuming a flat element with a constant source density over the area of the element. Boundary conditions are applied at control points on the elements producing a system of linear equations for the source density. When the source density is known, velocities and pressure coefficients may be calculated. The main purpose of this paper is to present the details of the approximation of an arbitrary three dimensional body using quadrilateral elements, and to provide a detailed derivation of the exact source panel integrations in order to gain insight for future research at Texas A&M University. A variation of the Hess method of surface discretization using quadrilateral source panels is described in detail as it is used in the XYZ Potential Flow program. The exact source panel integrations are derived in detail. GRA

DIFFUSION OF GASES IN POROUS SOLIDS: SIMULATION AND MEASUREMENT Final Technical Report
J. W. Evans Jan. 1986 47 p
(Contract DE-FG22-82PC-50796)
(DE86-005380; DOE/PC-50796/T9) Avail: NTIS HC A03/MF A01

The theoretical part of this investigation has achieved its objective. By means of the Monte Carlo simulation the Knudsen diffusion of gases in Swiss cheese solid has been studied and shown to yield results similar to studies on the cannonball solids that were the subject of a prior investigation at Berkeley. A correlation was developed that permits a prediction of the Knudsen diffusion coefficient of any gas in any porous solid with a monodisperse pore size distribution. The Monte Carlo technique has also been used to simulate ordinary diffusion in porous solids of both Swiss cheese and cannonball types, and a predictive correlation developed for this regime also. An unanticipated result of this study was the recognition of the analogy between diffusion of a gas in a porous solid and other transport phenomena in heterogeneous media. The Berkeley investigation has drawn together data from the Monte Carlo simulation, empirical predictive equations from the diffusion literature and classical results from theoretical physics on conduction in hetergeneous media. Finally the Monte Carlo technique was extended to porous solids with a bidisperse pore structure and it was again shown that the results are consistent with expectations. The experimental phase of this investigation has been successful in measuring the viscosities and diffusivities of a number of gases over a wide range of temperature of practical interest. The experimental results have been in agreement with the experimental data of others (mostly at lower temperature) and with theoretical predictions, in most instances. DOE

CALCULATION OF HEAT FLUX THROUGH A WALL CONTAINING A CAVITY: COMPARISON OF SEVERAL MODELS
J. E. Park, J. R. Kirkpatrick, J. N. Tunstall, and K. W. Childs Feb. 1986 30 p
(Contract DE-AC05-84OT-21400)
(DE86-010348; K/CSD/TM-59) Avail: NTIS HC A03/MF A01

This paper describes the calculation of the heat transfer through the standard stud wall structure of a residential building. The wall cavity contains no insulation. Results from five test cases are presented. The first four represent progressively more complicated approximations to the heat transfer through and within a hollow wall structure. The fifth adds the model components necessary to severely inhibit the radiative energy transport across the empty cavity. Flow within the wall cavity is calculated from the Navier-Stokes equations and the energy conservation equation for an ideal gas using an improvement to the Implicit-Compressible Eulerian (ICE) algorithm of Harlow and Amsden. An algorithm is described to efficiently couple the fluid flow calculations to the radiation-conduction model for the solid portions of the system. Results indicate that conduction through still plates contributes less than 2% of the total heat transferred through a composite wall. All of the other elements (conduction through wall board, sheathing, and siding; convection from siding and wallboard to am bients; and radiation across the wall cavity) are required to accurately predict the heat transfer through a wall. Addition of a foil liner on one inner surface of the wall cavity reduces the total heat transferred by almost 50%. DOE

CRITICAL FLOW THROUGH SMALL PIPE BREAKS Final Report
J. L. Anderson and R. L. Benedetti May 1986 169 p
(Contract DE-AC07-76ID-01570)
(DE86-010907; EPRI-NP-4532) Avail: NTIS HC A08/MF A01

A series of experiments have been performed investigating the phenomena of liquid entrainment and vapor pull-through at a tee junction between a horizontal pipe and a small branchline. These experiments were performed under conditions of stratified steam-water flow at 3.4, 4.4, and 6.2 MPa in the 28.4 cm diameter mainline, and critical flow through a nozzle installed in the branchline. Two orientations of the branchline were investigated: horizontal and vertical downflow. This report documents the experimental program, presents the data obtained, and discusses correlations for predicting the levels at which the onset of vapor pull-through and liquid entrainment occur and correlations for predicting the flow quality into the branchline. DEVELOPMENT OF ADVANCED THERMAL INSULATION FOR APPLIANCES Progress Report, Jul. 1984 - Jun. 1985
D. W. Yarbrough, F. J. Weaver, R. S. Graves, and D. L. McElroy May 1986 50 p
(Contract DE-AC05-84OR-21400)
(DE86-011357; ORNL/CON-199) Avail: NTIS HC A03/MF A01

Numerical simulations of the radial heat flow apparatus used to measure the apparent thermal conductivity (k sub a) of powders with high thermal resistance (R) showed that heat losses from the ends of the cylindrical specimen and core heater cause the k sub a of the specimen to be greater than the true value. This effect is large when high-R powders are tested. A radial apparatus 91 cm in length, ORNL-5, was constructed and used to reduce uncertainties introduced by end losses. ORNL-5 was used to test mixtures of low-cost coarse fumed-silica particles and relatively uniform, but expensive, fine fumed-silica particles. R-values per inch (2.54 cm) in air near 7 have been measured for pure fumed-silica powders. The thermal resistances of mixtures of coarse and fine powders were determined in the range 290 to 340°K at atmospheric pressure. Results show that R per inch depends on density and that R-values per inch greater than 5 can be achieved with such mixtures. R-values for a mixture of nominal 7-nm fine silica and coarse silica have been measured as a function of pressure near 300°K , and R per inch greater than 40 has been achieved in vacuum (<10 Pa). Linear heat flow measurements on evacuated rectangular panels showed that R per inch for the panels dropped from 16.8 to 15.9 in two years. DOE

DAMPING FORCE EXERTED BY A VISCOUS MEDIUM UPON AN OSCILLATING CYLINDER [DEMPINGSKRACHT UITGEOEFEND DOOR EEN VISCEUS MEDIUM OP EEN OSCILLERENDE CYLINDER]
Thomas E. M. Meijssen Jul. 1984 73 p In DUTCH Sponsored by Koninklijke/Shell Exploratie en Produktie Lab., Rijswijk, Netherlands
(ESA-86-97374) Avail: NTIS HC A04/MF A01

The damping force which an unlimited, homogenous, incompressible, and viscous medium of certain density and kinematic viscosity exerts on an oscillating, infinitely long, stiff, circular cylinder was determined for offshore purposes. The oscillation amplitude is supposed much smaller than the cylinder radius. Three fields, characterized by order magnitudes of the so-called flow Reynolds number Rs, were distinguished: Rs much less than 1, Rs = 0(1), and Rs much greater than 1. Solutions for the related flow functions and corresponding expressions for the damping force are discussed. ESA

REENTRY BODY THREE-DIMENSIONAL FLOW COMPUTATION. (EULER AND PARABOLIZED NAVIER-STOKES) [CALCULS D'ECOULEMENT AUTOUR DE CORPS DE RENTREE (EULER ET NAVIER-STOKES PARABOLISE)]
Moules and Bourg 1986 29 p In FRENCH Presented at 22nd AAAF Colloque dAerodynamique Appliquee Lille, 13-15 Nov. 1985
(SNIAS-861-422-107; ESA-86-97595) Avail: NTIS HC A03/MF A01

The steady flow Navier-Stokes equations are written in nonorthogonal curvilinear coordinates where one of them is the general flow direction. The shock layer is completely viscous, considering a body at hypersonic velocity, at high altitude, with an incidence angle. Wind tunnel tests with helium and air were used to validate the method. The computation time for an axisymmetric body without incidence is 1 to 3 min using an IBM 3081 computer. Bodies with incidence require times of up to 1 hr. ESA

ON WINGS AND KEELS (2)

J. W. Slooff May 1985 23 p Presented at 12th AIAA Ann. Symposium on Sailing (The Ancient Interface XIL), Seattle, Wash., 21-22 Sept. 1985

(NLR-MP-85048-U; B8664739; ESA-86-97679) Avail: NTIS HC A02/MF A01

The physical mechanisms governing the hydrodynamics of sailing yacht keels and the parameters that, through these mechanisms, determine keel performance are discussed. It is concluded that due to the presence of the free water surface optimum keel shapes differ from optimum shapes for aircraft wings. Utilizing computational fluid dynamics analysis and optimization it is found that the performance of conventional keels can be improved significantly by reducing taper or even applying inverse taper (upside-down keel) and that decisive improvements in performance can be realized through keels with winglets. HYDRODYNAMIC INSTABILITIES AND SURFACE WAVES IN A FLOW OVER AN IMPEDANCE WALL

S. W. Rienstra 20 Jun. 1985 12 p Presented at IUTAM Symposium on Aero and Hydroacoustics, Lyon, 3-6 Jul. 1986 Submitted for publication

(NLR-MP-85053-U; B8664360; ESA-86-97680) Avail: NTIS HC A02/MF A01

A two dimensional analysis of the surface waves in a subsonic compressible uniform mean flow along an impedance wall is made. It is found that a maximum of four surface waves is possible. The regions of existence in complex impedance and wave number planes are given. One wave is found to travel upstream, while the others, one of which is an instability, propagate downstream. A Wiener-Hopf solution of plane wave scattering at a hard/soft discontinuity of the wall impedance in which the instability wave provides the additional degree of freedom to satisfy the Kutta condition at the impedance jump is constructed. The waves are limiting forms of irregular acoustic duct modes. ESA

INVESTIGATION OF DENSITY GRADIENT FLUCTUATIONS IN A TURBULENT JET BY MEANS OF THE LASER SCHLIEREN CROSSED-BEAM METHOD

Juergen Kompenhans, Hans R. Hoefer, and Sabine Rannenberg Oct. 1985 94 p Original language document was announced as N86-10027

(ESA-TT-942; DFVLR-FB-85-19; ESA-86-97578) Avail: NTIS HC A05/MF A01; original German version available from DFVLR, Cologne, West Germany DM 25.50

Density gradient fluctuations within a round, turbulent jet were investigated at Mach numbers of 0.62 and 0.95 by laser Schlieren photography. Cross spectral density, coherence function, and phase velocity of the density gradient fluctuations were obtained using an arrangement of two crossed laser beams at various distances from the nozzle. Information on coherent structures in a jet was obtained, even at high Mach numbers. ESA

CONDITIONED HOT-WIRE ANEMOMETER MEASUREMENTS AND STRUCTURAL ANALYSIS OF A TURBULENT SPOT IN A LAMINAR BOUNDARY LAYER [GECONDITIONEERDE SLOEIDRAADANEMOMETERMETINGEN EN STRUCTUURANALYSE VAN EEN TURBULENT SPOT OPGEWEKT IN EEN LAMINAIRE GRENSLAAG]

J. A. J. Martens Dec. 1985 101 p In DUTCH; ENGLISH summary

(MEAH-63; ESA-86-97712) Avail: NTIS HC A06/MF A01

The downstream development of a turbulent spot generated by a tripping wire in a laminar boundary layer was investigated in wind tunnel tests. Spot shape, vertical and lateral growth, ensemble-averaged structure, and isovelocity contours look similar to those of earlier experiments. The correlation coefficient in a turbulent spot is in good agreement with that in a turbulent boundary layer. A quadrant analysis of the product of the fluctuation velocity components in both directions shows that the second and fourth quadrant are the main contributors; their average fractional contributions are 80% and 75% respectively, while the first and third quadrant give a contribution of -30% and -25% respectively. The second quadrant does not dominate the fourth in a spot in contrast with a turbulent boundary layer. ESA

COHERENT VORTEX STRUCTURES IN THE WAKE OF A RIGID AND AN EXTERNALLY DRIVEN DISK Ph.D. Thesis - Technische Univ., Berlin, West Germany

Dietmar Scholz Dec. 1985 177 p In GERMAN; ENGLISH summary

(DFVLR-FB-86-04; ISSN-0171-1342; ESA-86-97587) Avail: NTIS HC A09/MF A01; DFVLR, Cologne, West Germany DM 46

Coherent vortex structures were studied by comparing the large scale coherent flow structure in the wake of a rigid vertical circular disk with the turbulent structures behind the externally driven disk. The periodic vortex structures in these wakes can be decomposed via cross-correlation measurements with hot wires and microphones, particularly by using representations of coherences, phase relations, and azimuthal modes. In the very near wake, coherent periodic pressure oscillations due to pulsing of the recirculation bubble are superposed onto pressure fluctuations of the naturally occurring helical vortex structures which dominates in the entire flow region outside the recirculation bubble. NUMERICAL SIMULATION OF THE ACTIVE CONTROL OF LAMINAR-TURBULENT TRANSITION IN THE FLAT-PLATE BOUNDARY LAYER Ph.D. Thesis - Karlsruhe Univ., West Germany

Eckart Laurien Jan. 1986 121 p In GERMAN; ENGLISH summary

(DFVLR-FB-86-05; ISSN-0171-1342; ESA-86-97588) Avail: NTIS HC A06/MF A01; DFVLR, Cologne, West Germany DM 36

Laminar-turbulent transition in the flat-plate boundary layer was simulated starting from Tollmein-Schlichting waves. Using the spatially periodic simulation model, the three-dimensional incompressible Navier-Stokes equations were solved by a spectral method. For the direction normal to the wall a Chebyshev collocation method was developed. The classical Klebanoff type and the subharmonic type were simulated. Up to the spike stage the results agree well with hot-wire measurements. The transition can be actively delayed by local two-dimensional suction blowing, if it is applied in the early stages. ESA

HC A08/MF A01; DFVLR, Cologne, West Germany DM 36.50

Plane sound waves and higher acoustic modes, generated by turbulence occurring in the flow separation region downstream of a discontinuous enlargement in the circular cross-sectional area of a pipe, were investigated. Measurements of the axial phase velocity of pressure fluctuations show that turbulence fluctuations dominate in the region of flow separation just behind the jump in cross-sectional area, whereas further downstream the field is primarily determined by fluctuations of the aerodynamically generated sound waves. A decomposition of the pressure fluctuations shows that in the mixing region of the jet, the fluctuation energy is primarily distributed among several azimuthal components, while further downstream almost all the energy in the frequency range below the cut-off frequency of the first higher-order mode is concentrated in the axially symmetric component. FINITE ELEMENT, STREAM FUNCTION-VORTICITY SOLUTION OF SECONDARY FLOW IN THE CROSS-PLANE OF NONCIRCULAR CHANNELS

W. Slagter and H. Koning Dec. 1985 67 p

(ECN-175; B8665001; ESA-86-98065) Avail: NTIS HC A04/MF A01

A finite element method was applied to predict features of the fully developed turbulent flow in noncircular passages. The primary, axial flow, and turbulent kinetic energy distributions were predicted for fully developed turbulent flow conditions up to the wall. The secondary velocity is represented by the stream function-vorticity formulation and the no-slip boundary conditions are explicitly introduced in the nonlinear equations by a boundary vorticity formula. The Newton-Raphson method is applied to the stream function-vorticity equations and the resulting set of equations is solved simultaneously by the frontal solution technique. A one-equation eddy viscosity model of turbulence and an algebraic stress transport model were used to predict primary axial velocity, secondary velocities, and turbulent kinetic energy. The predictions obtained for a central subchannel of an equilateral triangular rod array with p/d = 1.3 are in reasonable agreement with experimental data. ESA

PARAMETRIC STUDY OF BEAM REFRACTION PROBLEMS ACROSS LASER ANEMOMETER WINDOWS

Albert K. Owen Jun. 1986 33 p Presented at the Third International Symposim on Applications of Laser Anemometry to Fluid Mechanics, Lisbon, Portugal, 7-9 Jul. 1986; sponsored by the Instituto Superior Tecnico

(NASA-TM-87350; E-3064; NAS 1.15:87350; USAAVSCOM-TR-86-C-16) Avail: NTIS HC A03/MF A01 CSCL 14B

The experimenter is often required to view flows through a window with a different index of refraction than either the medium being observed or the medium that the laser anemometer is immersed in. The refraction that occurs at the window surfaces may lead to undesirable changes in probe volume position or beam crossing angle and can lead to partial or complete beam uncrossing. This report describes the results of a parametric study of this problem using a ray tracing technique to predict these changes. The windows studied were a flat plate and a simple cyclinder. For the flat-plate study: (1) surface thickness, (2) beam crossing angle, (3) bisecting line - surface normal angle, and (4) incoming beam plane surface orientation were varied. For the cylindrical window additional parameters were also varied: (1) probe volume immersion, (2) probe volume off-radial position, and (3) probe volume position out of the R-theta plane of the lens. A number of empirical correlations were deduced to aid the interested reader in determining the movement, uncrossing, and change in crossing angle for a particular situation. Author

A DENSITOMETRIC ANALYSIS OF IIaO FILM FLOWN ABOARD THE SPACE SHUTTLE TRANSPORTATION SYSTEM STS-3, STS-6, AND STS-7 Semiannual Report, Dec. 1986

Ernest C. Hammond, Jr., Kevin A. Peters, and Pamela F. Atkinson 1986 23 p

(Contract NsG-5074)

(NASA-CR-176864; NAS 1.26:176864) Avail: NTIS HC A02/MF A01 CSCL 14E

Three canisters of IIaO film were prepared along with packets of color film from the National Geographic Society, which were then placed on the Space Shuttle #3. The ultimate goal was to obtain reasonably accurate data concerning the background fogging effects on IIaO film as it relates to the film's total environmental experience. This includes: the ground based packing, and loading of the film from Goddard Space Flight Center to Cape Kennedy; the effects of the solar wind, humidity, and cosmic rays; the Van Allen Belt radiation exposure; various thermal effect; reentry and off-loading of the film during take off, and 8 day, 3 hour 15 minutes orbits. The total densitometric change caused by all of the above factors were examined. The results of these studies have implications for the utilization of IIaO spectroscopic film on the future shuttle and space lab missions. These responses to standard photonic energy sources will have immediate application for the uneven responses of the film photographing a star field in a terrestrial or extraterrestrial environment with associated digital imaging equipment. ADVANCED OPTICAL MEASURING SYSTEMS FOR MEASURING THE PROPERTIES OF FLUIDS AND STRUCTURES
Arthur J. Decker 1986 37 p Presented at the Symposium on Propulsion Instrumentation, Jiangyou, China, 6-10 Oct. 1986; sponsored by NASA and the Chinese Aeronautical Establishment
(NASA-TM-88829; E-3204; NAS 1.15:88829) Avail: NTIS HC A03/MF A01 CSCL 20F

Four advanced optical models are reviewed for the measurement of visualization of flow and structural properties. Double-exposure, diffuse-illumination, holographic interferometry can be used for three-dimensional flow visualization. When this method is combined with optical heterodyning, precise measurements of structural displacements or fluid density are possible. Time-average holography is well known as a method for displaying vibrational mode shapes, but it also can be used for flow visualization and flow measurements. Deflectometry is used to measure or visualize the deflection of light rays from collimation. Said deflection occurs because of refraction in a fluid or because of reflection from a tilted surface. The moire technique for deflectometry, when combined with optical heterodyning, permits very precise measurements of these quantities. The rainbow schlieren method of deflectometry allows varying deflection angles to be encoded with colors for visualization. Author

MULTIPLE THERMOCOUPLE TESTING DEVICE Patent
James R. Hildebrand and Kurt J. Sobanski, inventors (to Air Force) Issued 18 Feb. 1986 11 p Supersedes AD-D009951
(AD-D012276; US-Patent-4,571,689; US-Patent-Appl-SN-435515; US-Patent-Class-364-481) Avail: NTIS Avail: US Patent and Trademark Office CSCL 09/5

An automated multiple thermocouple testing device determines short and open circuits in a thermocouple system. The thermocouple system that has a plurality of temperature probes, each probe has a first thermocouple. The device applies a direct current voltage to the first thermocouple to cause heating in the second thermocouple and a second thermocouple and then reads the temperature response of the second thermocouple. The first thermocouples have a common lead and the second thermocouples are connected in two parallel groups. The temperature output of the second thermocouple is digitized and read by a computer. These readings are compared to criteria which determine if there is an open circuit. Before the open circuit test is applied, the device also determines which thermocouple probe has a possible short circuit. This device can automatically test for short and open circuits in a thermocouple system within a few minutes without the necessity of removing the probes from their installed position. This device was adapted to perform the above testing on a F100 fan turbine inlet temperature (FTIT) system. GRA

ANALYSIS OF HIGH POWER RF WINDOWS FOR GYROTRONS Final Report, Sep. 1982 - Sep. 1985
Anton G. Krycuk Jan. 1986 54 p
(Contract F30602-82-C-0161)
(AD-A167424; UTEC-85-080; RADC-TR-85-254) Avail: NTIS HC A04/MF A01 CSCL 09/5

The project was undertaken to simplify the multidisk dielectric window design process for gyrotrons. The response of many discrete combinations of high power radiofrequency window thicknesses is analyzed in an effort to locate the optimum configurations. This report presents a method of numerically optimizing the design procedure. The window region of the gyrotron is severely overmoded, so care must be taken that the window be able to pass the energy contained in the high power modes to avoid overheating or reflection. To this end, the first part of this paper deals with a numerical solution of Solimar's modified telegraphist equation, which allows for the mode content intercepting upon the window to be found. The actual window design optimization is accomplished through the use of an n dimensional simplex method, where n is the number of window elements. Criteria delineating the search region are presented as well as typical problems which could be encountered during the optimization process. Results are given for both the mode content and the optimization. Mode content was compared against results given by a comparable proven algorithm, while window parameters were checked against existing designs with good correlation. GRA

CHINESE JOURNAL OF LASERS (SELECTED ARTICLES)
Fuxi Gan and Yinxia Zhang 22 Apr. 1986 54 p Transl. into ENGLISH from Zhong Guo Jiguang (China), v. 11, no. 8, 1984 p 449-463
(AD-A167846; FTD-ID(RS)T-0004-86) Avail: NTIS HC A04/MF A01 CSCL 20/5

A general review is made on the past and future of the research progress on laser crystals in China. Some proposals are offered in order to open up a new prospect for the development of laser crystals. Various methods for measuring different kinds of physical properties of laser glasses also have been investigated and the corresponding apparatus have been installed. Emphasis is laid on the inspection of optical quality of large size glass products, and a laser holographic interferometer for optical homogeneity measurement has been developed. This paper also reports some fundamental research results on laser glasses. By using laser glass spectroscopy, the special properties and structural state of rare earth ions in inorganic glasses were investigated before. The study of spectral and luminescent properties of Nd doped glasses was emphasized. Further detailed studies of the influence of the glass bases on spectral properties of Nd ion and the energy transfer process of Nd ions in glasses were made. GRA

RADIAL VELOCITY SPECTROMETERS. WHAT THEY MEASURE
Laurence G. Taff 24 Mar. 1986 24 p
(Contract F19628-85-C-0002)
(AD-A167986; TR-738; ESD-TR-85-304) Avail: NTIS HC A02/MF A01 CSCL 17/8

This report provides the theoretical analysis, within the framework of special relativity, for the information content of a radial velocity spectrometer. This device is an automated telescope photometer spectrometer combination. It measures the displacement between a Doppler shifted set of spectral lines and its at-rest version. Thus, it provides a measurement of radial velocity. Exactly what kinematical content is revealed by such a measurement within the solar system is brought out herein. The discussion is couched in terms of a satellite-based sensor observing another orbiting body. Both objects are presumed to orbit about the Earth. Sufficient generality is presented to treat any other case also. In the specific case of interest, both the topocentric distance and the topocentric radial velocity are present in the measured quality. GRA

APPLICATION OF NEW TECHNOLOGIES TO RADIATION BIODOSIMETRY IN MAMMALIAN SYSTEMS Final Report, 3 Jan. - 31 Dec. 1984
Robert M. Sutherland, Edith M. Lord, and Peter C. Keng Feb. 1986 33 p
(Contract F33615-84-C-0603)
(AD-A168176; USAFSAM-TR-85-66) Avail: NTIS HC A03/MF A01 CSCL 06/18

Mononuclear cells from peripheral blood are presently the best candidates for a space radiation biodosimeter for man because they are easily obtained, and are among the most radiosensitive cells in the body. They are, however, members of a highly heterogeneous population of cell subtypes potentially differing in radiosensitivities. To study the cell subpopulation holding the greatest potential for use as a biodosimeter, the cell types must be uniquely identified, and/or separated so that subtle effects on radiosensitive cells are not masked by non-effects on relatively radioresistant cells present in a mixed population. Flow cytometry and centrifugal elutriation are proving to be useful for identifying and separating individual subpopulations from heterogeneous mixtures of cells. Flow cytometry uses fluorescent antibodies to label and sort the cells of interest, while centrifugal elutriation utilizes counterbalanced centrifugal and fluid flow forces to separate cells by size. In combination with two analytical procedures (premature chromosome condensation (PCC) and alkaline elution), these two techniques have been applied to study radiation effects on mononuclear cells from mouse peripheral blood irradiated in vivo, and cell cycle phase specific repair of single-strand breaks in cellular deoxyribonucleic acid (DNA) of the Chinese hamster ovary (CHO) fibroblast cell line irradiated in vitro. WORKSHOP ON STANDARDS FOR PHOTONIC STREAK CAMERA CHARACTERIZATION
G. L. Stradling 1985 6 p Presented at the SPIE International Technical Symposium on Optical and Electro-Optical Engineers, San Diego, Calif. 18 Aug. 1985
(Contract W-7405-eng-36)
(DE86-002430; LA-UR-85-3834; CONF-850887-41) Avail: NTIS HC A02/MF A01

A summary paper proposing standardization of definitions and parameter measurements related to photonic streak cameras was generated at the 16th International Congress of High Speed Photography and Photonics at Strasborg, France (August 1984). An international committee appointed by the general Workshop on Picosecond Streak Cameras met and discussed the areas appropriate for standardization and proposed specific definitions, measurements and complementary parameter sets to be used in characterizing photonic streak cameras. These proposals were compiled into a summary paper by the committee co-chairmen, Noel Fleurot (CEA-Limeil) and Gary L. Stradling (Los Alamos National Laboratory), with the intent that it be distributed to interested streak camera users and manufacturers and that appropriate improvements and additions be solicited. OPTICAL PROFILING INSTRUMENT FOR THE MEASUREMENT OF THE FIGURE AND FINISH OF OPTICAL QUALITY SURFACES
E. L. Church and P. Z. Takacs Sep. 1985 36 p Presented at the 3rd International Conference on the Properties and Metrology of Engineering Surfaces, Middlesborough, England, 10 Apr. 1985 Prepared in cooperation with Brookhaven National Lab., Upton, N.Y.
(Contract DE-AC02-76CH-00016)
(DE86-009433; BNL-37880; CONF-8504226-1) Avail: NTIS HC A03/MF A01

This paper discusses the use of WYKO non-contracting optical profiling microscope for the measurement of the figure and finish of optical-quality surfaces. THe original instrument and our hardware and software modifications are described along with recent and current studies making use of this facility. DOE

SOLID STATE IMAGE SENSOR WITH AN AMORPHOUS PHOTOCONVERSION LAYER Final Report, Feb. 1984
Bernd Heimann, Ulrich Traupe, Heiner Herbst, and Karl Kempter Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 76 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-164; ISSN-0340-7608; ESA-86-97443) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 16

A solid state image sensor using an amorphous silicon layer (a-Si:H) on top of a 100x100 pixel readout matrix was developed. The sensor features a linear signal characteristic at low illumination levels and a nonlinear one at high illumination levels; it is thus capable of transferring a higher dynamic range. Blooming was suppressed to a value one fifth of that of monolithic MOS-sensors. The sensor is suitable for color television applications. The sensitivity is a little low compared to monolithic image sensors; the cause of the sensitivity decay and measures to improve the value are discussed. Based on results of sandwich-structure a-Si depositions on glass substrates and a-Si photolayers incorporated in vidicon tubes, the structure of the sensor image part was determined to be Al(a-Si:H)ITO. Test equipment was designed and installed to check sensor data. ESA

OPTOELECTRONIC CURRENT TRANSDUCER Final Report, May 1984
Klaus Hoffman Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 87 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-165; ISSN-0340-7608; ESA-86-97444) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 18.50

A current transducer which permits the measurement of high currents in high voltage substations by means of the Faraday effect in optical monomode fibers was developed. The measuring system has a large bandwidth and a linear signal-to-current characteristic up to high currents without saturation. High voltage insulation presents no serious problems. A V-grooved semiconductor laser is used as light source and is installed in a solid case which also houses the detection unit. The monomode fiber is placed in a teflon hose, loosely and sufficiently twisted to avoid birefringence. The fiber is coupled to the laser by gradient index lenses. Astigmatism is reduced by ellipsoidal shaping and etching of the fiber end to form a lens-like element. Part of the device was tested in the laboratory. With a 62- turn primary fiber coil,

the minimum detectable signal is 0.15 Amp-turns. It is shown that the magnetooptical transducer can be improved. Measurements in a high power bus and a comparison with simultaneous conventional current measurements are planned. ESA

DEVELOPMENT OF A DIGITAL SIGNAL PROCESSOR Final Report, Apr. 1985
Peter Anders, Klaus Herberle, Bernhard Schmid, Arnold Uhlenhoff, Manfred Ulrich, Martin Winterer, Edmund Zaehringer, Mandred Immendoerfer (Standard Elektrik Lorenz A.G., Stuttgart, West Germany), Siegbert Hentschke, Dieter Kopp et al Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 254 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-181; ISSN-0340-7608; ESA-86-97449) Avail: NTIS HC A12/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 42

A digital signal processor whose architecture was optimized for signal processing algorithms was developed. The processor has a multibus structure, distributed memories, and uses pipelined program execution. The basic arithmetic instruction is multiply and add, carried out within 2 instruction cycles of 100 msec each. Development tools such as cross-assembler, simulator (debugger), and in-circuit emulator are provided for the design of consumer applications. Due to its high computing speed and low power dissipation, the digital signal processor has a wide range of possible applications. ESA

INTERFEROMETRIC HOLOGRAPHIC CINEMATOGRAPHY [CINEHOLOGRAPHIE INTERFEROMETRIQUE]
H. Fagot 12 Jul. 1985 17 p In FRENCH Presented at HOLOPRO 85 Conference, Belfort, France, 21 Jun. 1985
(ISL-CO-219/85; ESA-86-97628) Avail: NTIS HC A02/MF A01

Double exposition holographic interferometry was employed to obtain a 35 mm scientific film. The deformations and deplacements of a loudspeaker were visualized at 20 to 70 Hz vibration frequencies. A 30 mJ YAG laser was used. The two successive pulses of each hologram are produced at 4 ms interval by the same laser beam. The 35 mm camera operates at 10 Hz. The device is limited to low frequency phenomena. The development of higher frequency systems is discussed with a view to nondestructive control of vibration in aircraft structures. ESA

A REMOTE CONTROLLED CALIBRATION DEVICE FOR DISPLACEMENT TRANSDUCERS
G. L. Tjoa and R. denBoef Nov. 1985 23 p
(ECN-173; B8577864; ESA-86-97732) Avail: NTIS HC A02/MF A01

A mechanical system to calibrate extensometer transducers at ambient temperature in a shielded facility for examining mechanical properties (especially creep) of irradiated materials is described. The system consists of a piezoelectric translator including a microprocessor-based controller in a calibration rig. Two transducers can be verified simultaneously. The equipment was integrated into a computer controlled data acquisition system to provide for the required data processing and analysis. The system functions satisfactorily, showing high resolution and accuracy, and is easy to operate remotely. ESA

INTERNATIONAL COMPARISON OF INTERPOLATION PROCEDURES FOR THE EFFICIENCY OF GERMANIUM GAMMA-RAY SPECTROMETERS (GAM83 EXERCISE)
Willem Zijp, Adelbertus N. Polle, and Henk J. Nolthenius Jan. 1986 83 p
(ECN-181; ICRM-S-13; B8661179; ESA-86-97737) Avail: NTIS HC A05/MF A01

Forty-one laboratories determined full energy peak efficiencies and activities of a gamma of ray spectrometer by their own procedures, starting from supplied peak-efficiency data. Four data sets for four different conditions of germanium detectors were distributed. The great variety of fitting functions combined with the calculated large standard deviation of the parameters (709) and the strong correlations which are observed, indicates that no single physical acceptable function can be recommended as a general purpose model for describing the efficiency curve of a semiconductor gamma ray spectrometer. ESA

COMPUTER ASSISTED MEASUREMENT TECHNIQUES IN LASER DOPPLER ANEMOMETRY (LDA). PART 1: DATA ACQUISITION. PART 2: DATA REDUCTION
H. J. Pfeifer 15 May 1985 50 p Presented at Von Karman Inst. for Fluid Dynamics Lectures Series on the Computer in Experimental Fluid Dynamics, Rhode Saint Genese, Belgium, 6-10 May 1985
(ISL-CO-210/85-Pt-1-Pt-2; ESA-86-97625-Pt-1-Pt-2) Avail: NTIS HC A03/MF A01

The role of computers as part of the instrumentation in laser Doppler anemometry is reviewed. It is shown that no useful configuration of such an anemometer can be set up without powerful computer assistance. Computer utilization in data acquisition with counter processors, transient recorders and photon correlators is examined. The optimum use of the anemometer requires also computerized control of various parts of the system, such as filter banks and traverse systems. ESA

A SINGLE SIDEBAND SUPPRESSED CARRIER (SSBSC) INTERFEROMETER FOR THE MEASUREMENT OF DIELECTRIC PROPERTIES OF LASER HEATED MATERIALS
J. Pierson 22 Oct. 1985 10 p Presented at 15th European Microwave 85 Conference, Paris, France, 9-13 Sep. 1985
(ISL-CO-228/85; ESA-86-97630) Avail: NTIS HC A02/MF A01

A method to measure the dielectric properties of ceramic materials at high temperatures is described. The device is a Ka band microwave bridge which uses a single sideband suppressed carrier signal as reference. A carrier modulated by ferrite modulator around its maximum insertion loss gives a double sideband suppressed carrier signal. By addition of two such signals the SSBSC is obtained. The high rejection of the carrier and the other sideband gives results with the required accuracy. By this method the temperature range of dielectric measurements is extended to 2500 K. ESA

NONLINEAR OPTICAL INTERACTIONS IN SEMICONDUCTORS Final Report, 10 Aug. 1983 - 31 Dec. 1985
Michael M. Salour 10 Dec. 1985 16 p
(Contract F49620-83-C-0147)
(AD-A166182; AFOSR-86-0089TR) Avail: NTIS HC A02/MF A01 CSCL 20/5

The optical pumping technique in GaAs has led to the development of a novel and highly sensitive optical temperature sensor. Completed is the experiment on two photon optical pumping in ZnO. An external cavity semiconductor laser involving ZnO as a gain medium was demonstrated under two-photon excitation. This laser should have a major impact on the development of tunable blue green radiation for submarine communication. Completed is a paper on heat buildup in semiconductor platelets. New lasers are used to explore elementary excitation in optical thin film layers of semiconductors. This has led to the first demonstration of the feasibility of room temperature operation of a tunable coherent source involving multiple quantum well material. Completed is the construction of a simple remote (non-contact) temperature sensor to directly measure heat buildup in semiconductor materials as a result of high power optical laser excitation. Finally, an experiment involving optical frequency mixing to probe electrodynamics in the GaAlAs multiple quantumwell and superlattice structures, utilizing two recently constructed tunabel laser systems,has been successful. Attempts were focused on observing a number of new optical effects including nonlinear absorption and transmission phenomena, enhanced spontaneous and stimulated light scattering processes, etc. The construction of an external cavity semiconductor HgCdTe has been successful. CURRENT STATUS IN DEVELOPMENT OF AVERAGING LASER STRAINOMETER AND TESTING SYSTEM
R. L. Brady 19 Jun. 1986 14 p Presented at the 41st Meeting of the IMOG Subgroup on Environmental Testing, Miamisburg, Ohio, 18 Jun. 1985
(Contract W-7405-eng-48)
(DE86-006727; UCRL-92746; CONF-8506117-4) Avail: NTIS HC A02/MF A01

The advent of a new method of sweeping a laser beam to accurately measure a shadow image offers unique applications to mechanical testing. A new commercial low power continuous wave laser system designed for metrological applications is being applied to the testing of a delicate, brittle, notch sensitive, hygroscopic material requiring dry box enclosure. An integrated testing system is being developed to provide remote strain sensing of minimum, maximum, and average surface strains on the cylindrical portion of a compression specimen. The system additionally provides the means to compensate for bending strains observed in pretest alignment evaulation. The results of the development of the testing fixture to date are discussed. EXPERIMENTAL INVESTIGATIONS OF THE ROLE OF LASER FIELD FLUCTUATIONS IN NON-LINEAR OPTICAL ABSORPTION PROCESSES
S. J. Smith 1985 11 p Presented at the 6th International Conference on Coherent Optics, Ustron, Poland, 19 Sep. 1985
(Contract DE-AC02-80ER-10736)
(DE86-006919; CONF-8509245-1) Avail: NTIS HC A02/MF A01

In the experimental program described, a well-stabilized single mode laser beam was deliberately broadened by introducing fluctuations to the laser frequency in order to synthesize laser power spectra for which the fluctuations are well-characterized to all orders in a statistical sense. This technique produces single mode laser fields which have nearly Lorentzian power spectra at one limit, essentially Gaussian power spectra at the other limit, and which may be varied continuously between these two limits. COATINGS FOR HIGH ENERGY APPLICATIONS. THE NOVA LASER
G. R. Wirtenson 1986 35 p Presented at the Los Angeles Symposium and Exhibition on Optical and Electro-optical Engineering, Los Angeles, Calif., 19 Jan. 1986
(Contract W-7405-eng-48)
(DE86-009407; UCRL-93950; CONF-860117-8) Avail: NTIS HC A03/MF A01

The combined requirements of energy density, multiple wavelength, and aperture make the coatings for the Nova Inertial Confinement Fusion (ICF) laser unique. This ten beam neodymium glass laser system, built at the Lawrence Livermore National Laboratory (LLNL), has over a thousand major optical components; some larger than one meter in diameter and weighing 380 Kg. The laser operates at 1054 nm and can be frequency doubled to 527 nm or tripled to 351 nm by means of full aperture potassium dihydrogen phosphate (KDP) crystal arrays. The 1.0 nsec fluence varies along the laser chain, sometimes reaching values as high as 16 J/cm(2) at the input lens to one of the spatial filters. The design specifications of this massive optical system were changed several times as the state-of-the-art advanced. Each change required redesign of the optical coatings even as vendors were preparing for production runs. Frequency conversion to include shorter wavelengths mandated the first major coating redesign and was followed almost immediately by a second redesign to reduce solarization effects in borosilicate crown glass. The conventional thermal evaporation process although successful

for the deposition of mirror coatings, was not able to produce antireflection coatings able to survive the locally high chain fluences. As a consequence it became necessary to develop another technique. Solution produced coatings were developed having transmissions exceeding 99% per part and damage threshold values equal to the bare substrate. The unique requirement of the Nova laser necessitated special deposition and metrology equipment. These programmatic developments will be reviewed in the context of the cooperative working relationship developed between LLNL and its vendors. It was this excellent relationship which has enabled LLNL to obtain these highly specialized coatings for the Nova laser. DOE

TIME AND SPACE RESOLVED SPECTROSCOPY OF X-RAY LASER EXPERIMENTS
N. M. Ceglio 1 Apr. 1986 23 p Presented at the 7th International Workshop on Laser Interaction and Related Plasma Phenomena, Monterey, Calif., 28 Oct. 1985
(Contract W-7405-eng-48)
(DE86-009403; UCRL-94257; CONF-851053-12) Avail: NTIS HC A02/MF A01

We report experimental data from one of the first of this new generation of instruments designed specifically for laboratory X-ray laser diagnosis. Representative TGSS-EM data are presented from three different X-ray laser inversion schemes: collisional excitation of neon-like selenium (lambda approx. = 206, 209A); resonant photoexcitation of hydrogen-like fluorine (lambda = 81A); and recombination of hydrogen-like magnesium (lambda approx. = 130A). The data illustrate the measurement capabilities of the TGSS-EM and provide insight to the dynamics and emission characteristics of this new class of laser produced plasmas. DOE

COMPETITION NOISE IN AN OPTICAL DIVIDER [KOMPETITIERUIS BIJ EEN OPTISCHE VERDELER]
G. J. A. M. vanLaarhoven May 1984 86 p In DUTCH
(ESA-86-97538) Avail: NTIS HC A05/MF A01

A model to determine the impact of competition noise on an optical communication system was set up. An optical divider based on the spatial wave front division principle and consisting of five fibers located in the radiation field of a laser diode without the use of optical devices was developed. Random fluctuations of the power of the laser causes competition noise. The theory was verified using random error measurements on the system. It is concluded that competition noise in an optical communication system can be neglected; the divider is recommended. ESA

INVESTIGATIONS OF LASER MIRRORS WITH DIFFERENT DESIGN
Rolf Gauert and Helmut Rosteck Dec. 1985 42 p In GERMAN; ENGLISH summary
(DFVLR-FB-85-65; ISSN-0171-1342; ESA-86-97584) Avail: NTIS HC A03/MF A01; DFVLR, Cologne, West Germany DM 17

Laser mirror reflectivity and integral backscattering were investigated. Mirrors were industrially fabricated, or were developed at DFVLR and have ZnS/MgF2 or Ag/ZnS/MgF2 interference coatings. The experimental mirror-coating machine was modified to get reproducible mirrors. The substrate holder was reconstructed so that privileged directions in the layer combination are suppressed. The measurement of the transmissibility during the coating process was carried out at an angle of incidence of 30 deg with a built-in deflection device. An IR heating device mounted into the machine enabled temperature of the substrates and the substrate holder to rise to 130 C. The effects limiting the mirror parameters, such as substrate temperature, impurities on the substrate surfaces, and evaporation speed, are discussed. The measurements show that substrate heating of ZnS/MF2 coatings provide hard and stable layers; the use of Ag/ZnS/MgF2 layer combinations increases the reflectivity by 0.1%. ESA

SURFACE FATIGUE AND FAILURE CHARACTERISTICS OF HOT FORGED POWDER METAL AISI 4620, AISI 4640, AND MACHINED AISI 4340 STEEL SPUR GEARS
Dennis P. Townsend 1986 34 p Presented at the Annual Meeting of the American Society of Lubrication Engineers, Toronto, Ontario, 12-15 May 1986
(NASA-TM-87330; E-3024; NAS 1.15:87330) Avail: NTIS HC A03/MF A01 CSCL 13I

Spur gear surface fatigue endurance tests were conducted to investigate hot forged powder metal AISI 4620 and 4640 steel for use as a gear material, to determine endurance characteristics and to compare the results with machined AISI 4340 and 9310 steel gear materials. The as-forged and unground SISI 4620 gear exhibited a 10 percent fatigue life that was approximately one-fourth of that for AISI 9310 and less than one-half that for the AISI 4340 gears. The forged and finish ground AISI 4620 gears exhibited a 10 percent life, approximately 70 percent that of AISI 9310 and slightly better than that of AISI 4340. The AISI 4640 hot forged gears had less fracture toughness and slightly less fatigue life than the AISI 4620 test gears. Author

MECHANICAL RELOCKER FOR LOCKING BOLTS Patent
Teddy L. Pickett and Henry L. Self, inventors (to Navy) Issued 7 Jan. 1986 6 p Supersedes AD-D010900
(AD-D012209; US-Patent-4,562,706; US-Patent-Appl-SN-577100; US-Patent-Class-70-1.5) Avail: US Patent and Trademark Office CSCL 13/5

This patent discloses a torsion spring which longitudinally

rotates a locking bolt when the bolt actuating linkages is severed. A woodruff key or the like is upstanding from a surface of the bolt. When the linkage is undamaged, the key slides with the bolt through a slot on the lock frame. When the bolt is rotated by the spring, it is locked in the rotated position by a locking pawl. In the rotated position, the key is out of registry with the slot and the bolt cannot be withdrawn from its extended, locking position. A second embodiment replaces the key with a recess in the bolt into which a locking pawl engages to prevent movement of the locking bolt. GRA

IMPROVED ROBOTIC KITTING STATION Patent Application
Howard A. Reuter, inventor (to Air Force) Filed 15 Jan. 1986 23 p
(AD-D012238; US-Patent-Appl-SN-819185) Avail: NTIS HC A02/MF A01 CSCL 15/5

The assembly of electrical components into kits is accomplished by: a computer controlled robot; rotary rack carousel; a work station; an elevator; and a system controller. The carousel houses a systematically stored supply of electrical components in trays. The elevator has a rotating turntable with two oppositely oriented motor driven tray inserting and extracting grippers which supply the trays to the work station so that the robot can assemble the kits. The work station has two tray receiving tables which are alternately shuttled side-to-side to supply the kitting robot with trays of components from the carousel via the elevator. In operation, the robot arm picks parts from tray 1 with the dual indexing table in a first predetermined position. During this time empty tray 2 is returned to the carousel or storage. When the turntable rotates, tray 3 is slid in position on the empty indexing table. After tray 1 is emptied the tables shuttle sideward and tray 1 is returned to the elevator turntable while tray 3 is emptied. The cycle is then repeated. GRA

IMPROVEMENT OF THE CORROSION RESISTANCE OF TURBINE ENGINE BEARINGS Final Report, Aug. 1981 - Aug. 1985
J. H. Mohn, H. M. Hodgens, II, H. E. Munson, and W. E. Poole Apr. 1986 207 p
(Contract F33615-81-C-2023)
(AD-A167355; PWA/GPD-FR-18566; AFWAL-TR-85-2097) Avail: NTIS HC A10/MF A01 CSCL 11/6

Improved bearing corrosion resistance can be achieved with either the use of a new corrosion resistant alloy, or by surface treating, or coating state-of-the-art M50 with a protective covering. This two-phase program investigated all three methods; alloys, coatings, and surface treatments. Appropriate bearing materials, surface treatments, and coatings were identified. Screening tests were performed on the most promising candidates. Candidates with potential for improving bearing corrosion resistance included corrosion resistant alloys such as CRB7 (AMS5900), and BG42 (AMS5749), coatings such as the proprietary chrome plating process called Armoloy, and surface treatments such as nickel sputter-coated M50. This program was aimed at developing an alternate material, fabrication technique, or material treatment of turbine engine mainshaft bearings with improved corrosion resistance compared to state-of-the-art VIM-VAR-M50. During Phase I, five corrosion-resistance bearing candidates (Armoloy-coated M50, nickel sputter-coated M50, wrought CRB7, RSR565, and MRC2001) were identified as the most promising. These were subjected to rolling contact fatigue, corrosion, hot hardness, and wear screening tests. GRA

A CLOSED-FORM SOLUTION FOR INVERSE KINEMATICS OF ROBOT MANIPULATOR WITH REDUNDANCY
Pyung H. Chang 31 Mar. 1986 27 p
(Contract N00014-85-K-0124)
(AD-A167850; AI-M-854) Avail: NTIS HC A03/MF A01 CSCL 13/9

A closed-form equation for inverse kinematics of robot manipulators with redundancy is derived, using the Lagrangian multiplier method. The proposed equation is proved to provide the exact equilibrium state of the resolved motion method, and is shown to be a general expression that yields the extended Jacobian method. The repeatability problem in the resolved motion method does not exist in the proposed equation. The equation is demonstrated to give more accurate trajectories than the resolved motion method. Author (GRA)

REDUNDANCY RESOLUTION OF MANIPULATORS THROUGH TORQUE OPTIMIZATION
John M. Hollerbach and Ki C. Suh Jan. 1986 18 p
(Contracts F33615-83-C-5115; N00014-77-C-0389)
(AD-A167851; AI-M-882) Avail: NTIS HC A02/MF A01 CSCL 13/9

Methods for resolving kinematic redundancies of manipulators by the effect on joint torque are examined. When the generalized inverse is formulated in terms of accelerations and incorporated into the dynamics, the effect of redundancy resolution on joint torque can be directly reflected. One method chooses the joint acceleration null-space vector to minimize joint torque in a least squares sense; when the least squares is weighted by allowable torque range, the joint torques tend to be kept within their limits. Contrasting methods employing only the pseudoinverse with and without weighting by the inertia matrix are presented. The results show an unexpected stability problem during long trajectories for the null-space methods and for the inertia-weighted pseudoinverse method, but rarely for the unweighted pseudoinverse method. Evidently a whiplash action develops over time that thrusts the endpoint off the intended path, and extremely high torques are required to overcome these natural movement dynamics. Author (GRA)

SAFE-ARM EXPLOSIVE TRANSFER MECHANISM Patent Application
Jensen, inventor (to Air Force) Filed 25 Feb. 1986 24 p
(AD-D012333; US-Patent-Appl-SN-833640) Avail: NTIS HC A02/MF A01 CSCL 19/1

A safe-arm mechanism for an air-delivered explosive device uses a slider containing explosive leads as the means of interrupting the explosive train. The slider is locked in the safe position such that the explosive leads are out-of-line with respect to the detonator. The slider is attached directly to the main parachute such that when two locks are removed the parachute deployment forces can overcome a shear pin lock and move the slider to an in-line or armed position where it is positively retained. In this position, initiation of the detonator will allow the explosive output of the detonator to be transferred to its associated explosive device and provide a dual point radial initiation of its booster charge. AUTOMATED VALVE EXPERTISE CAPTURE
D. L. Crandall 1985 6 p Presented at the Applications of Artificial Intelligence to Engineering Problems, Southampton, Engl., 15 Apr. 1985
(Contract DE-AC07-76ID-01570)
(DE86-004127; EGG-M-26885; CONF-8504204-1) Avail: NTIS HC A02/MF A01

Many experimental systems designed for energy research and development require the control of fluid flows. Selecting the appropriate valves for such systems is complicated not only by the uniqueness of the systems designed, but also by the availability of a variety of valves from a multitude of valve manufacturers. Individuals in large mechanical engineering organizations that design these experimental systems require comprehensive expert knowledge of valve selection but possess only limited portions of this experience based knowledge. Even though these organizations

have the expertise among their engineers, it is not consistently available to the right individual at the time of design. Expert systems (programs that solve problems by logical inference based on a store of knowledge) may eventually improve valve selection in mechanical design firms, but only if the problem of extracting and accumulating the expertise in the organization can be solved. This paper describes a computerized prototype titled VALVEFIND designed to accumulate specialized expertise in valve selection. DOE

CALORIMETRY OF THE ARC WELDING PROCESS
P. W. Fuerschbach and G. A. Knorovsky 1986 5 p Presented at the 2nd General Meeting on Calibration of Welding Systems, Livermore, Calif., 26 Feb. 1986
(Contract DE-AC04-76DP-00789)
(DE86-009280; SAND-86-0817C; CONF-860283-1) Avail: NTIS HC A02/MF A01

Minimizing the total heat input in arc welding is not usually a critical consideration when the size of the fusion zone and the weldment are very large. At SNLA, however, most welding can usually be described as microwelding. The depth of penetration is typically only 0.8 mm and hermeticity rather than mechanical strength is the primary joining requirement. For these type welds, minimizing heat input becomes a major process requirement since distortion of small components and damage to heat sensitive parts may result from large increases in the bulk temperature. In conclusion, we have found calorimetry to be a useful technique to determine the effect of arc welding process variables on heat input and melting efficiency and also to better select the required welding process for our weld geometries. FINITE-ELEMENT MODELING OF PINCH WELDS
K. E. Kain Mar. 1986 30 p
(Contract DE-AC09-76SR-00001)
(DE86-009573; DP-1715) Avail: NTIS HC A03/MF A01

Finite-element modeling was performed on pinch welds used to seal deuterium-tritium reservoirs at SRP. The analysis examined two of the possible failure mechanisms in these welds - service stresses and hydrogen/helium embrittlement. Both confined and unconfined weld geometries were considered. Service stresses due to the internal pressure of the deuterium-tritium gas mixture were modeled. Stress concentrations arising from an elastic material were examined along with those resulting from plastically deforming alloys. In addition, the analysis included deuterium and tritium diffusion along with radioactive decay of tritium to helium. Results show that the presence of embrittling species, in combination with large stress concentrations, would cause fracture if it occurred, to initiate preferentially in the corner regions of the tube. Comparisons of pinch weld geometries suggest that controlling weld contour will have minimal effect on resistance to crack growth. DOE

SENSOR-DRIVEN, FAULT-TOLERANT CONTROL OF A MAINTENANCE ROBOT
M. M. Moya and W. M. Davidson 1986 23 p Presented at the IEEE International Conference on Robotics and Automation, San Francisco, Calif., 14 Apr. 1986
(Contract DE-AC04-76DP-00789)
(DE86-002118; SAND-85-2152C; CONF-860434-3) Avail: NTIS HC A02/MF A01

A robot system has been designed which will perform routine maintenance tasks on the Sandia Pulsed Reactor (SPR). The use of this Remote Maintenance Robot (RMR) is expected to significantly reduce the occupational radiation exposure of the reactor operators. Reactor safety was a key issue in the design of the robot maintenance system. Using sensors to detect error conditions and intelligent control to recover from the errors, the RMR is capable of responding to error conditions without creating a hazard. This paper describes the design features and implementation methods used to create sensor-driven, fault-tolerant control of the RMR. Features which make the system more tolerant to error conditions include the following: mechanical tolerances, continuous monitoring of force sensors, monitoring of verification switches, index point referencing, spiral searching with force feedback, and operator supervision. The paper also describes the mechanisms for error recovery. Error recovery is not automatic; it does rely on operator assistance. However, a key feature of the error recovery proce dure is that the operator is allowed to reenter the programmed operation after the error has been corrected. The recovery procedure guarantees that the moving components of the system will not collide with the reactor during recovery. DOE

STIRLING MACHINES: ADIABATIC TO ISOTHERMAL
C. D. West 1986 19 p Presented at the 3rd International Stirling Engine Conference, Rome, Italy, 1 Jun. 1986
(Contract DE-AC05-84OR-21400)
(DE86-005407; CONF-860676-1) Avail: NTIS HC A02/MF A01

In most real Stirling engines the gas behavior in the cylinder is almost adiabatic, in contrast to the ideal Stirling engine in which all processes are isothermal. The combination of nearly adiabatic cylinders and nearly isothermal heat exchangers found in most Stirling engines leads to irreversibilities and loss of efficiency. Still worse, in many cases, is the performance of cylinders with a finite heat transfer intermediate between a near-adiabatic and near-isothermal behavior. Because of this behavior and because of the low thermal diffusivity of high-pressure gases, there is little hope of sufficiently enhancing the heat transfer within the cylinder of a conventional Stirling engine to increase the efficiency - in most cases, a decrease is more likely to result. ALCOHOL AS A FUEL IN A HIGH SPEED DIESEL ENGINE WITH DOUBLE INJECTION SYSTEM
J. Laurikko and J. Pitkaenen 1985 133 p In FINNISH
(DE86-751653; TKK-KO/PM-47) Avail: NTIS (US Sales Only) HC A07/MF A01

This report describes the results of tests carried out on a diesel engine equipped with two separate fuel injection systems and using alcohol as the main fuel. There is the possibility of

using pure alcohol as the main fuel in a diesel engine equipped with two fuel injection systems where ordinary diesel oil is used as ignition fuel. The advantages of this method are the large proportion of alcohol in the total amount of fuel and the possibility of using pure alcohol without the expensive ignition improving additive. The drawback is the high cost due to the complicated construction of the system, which is partly compensated by the cheaper fuel. The operation of a diesel engine with double injection systems is studied and the main parameters that control the combustion are compared to the data from similar tests given in the literature. The test results showed that from the parameters controlling the combustion the type of the auxiliary nozzle (i.e., the direction of the ignition fuel spray) had the strongest effect on engine performance. The B-type nozzle with fuel spray directed across the swirl in the combustion chamber gave better performance than the A-type, where ignition fuel was injected to the direction of the swirl. The B-type nozzle gave also better distribution and mixing of the ignition fuel, therefore the ignition lag of the main fuel was shorter and the brake thermal efficiency slightly better than with the A-type nozzle. MAGNETIC BEARINGS: AN ADAPTIVE SOLUTION TO MOTION-CONTROL PROBLEMS
M. B. Scudiere and G. T. Gillies Mar. 1986 33 p
(Contract DE-AC05-84OT-21400)
(DE86-010615; K/TS-11780) Avail: NTIS HC A03/MF A01

High-precision rotating machinery often employs sophisticated motion-control systems. Typical of such systems are magnetic bearings. In this paper, the operational principles of feedback systems for magnetically suspended rotors are explored, with special emphasis on the rotor position sensors, servo circuits, and sources of magnetomotive force. Several applications for these systems are identified, and some important design characteristics in magnetic bearing technology are reviewed. The role played by Martin Marietta Energy Systems, Inc., and the University of Virginia in research and development of new suspension/bearing technologies is discussed, and their most recent contributions to this field are presented. THERMAL HISTORY OF HT-9 WELDMENT HEAT-AFFECTED ZONES DURING WELDING
J. R. Foulds Apr. 1986 22 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract DE-AC03-84ER-53158)
(DE86-010684; GA-A-18430; CONF-860421-48) Avail: NTIS HC A02/MF A01

HT-9, a commercial 12Cr-1Mo ferritic steel, is a candidate structural material for fusion reactor first walls. The microstructure in weldments of this material has been observed to vary over short distances as a function of the varying thermal history during welding. An example is the observation of several heat-affected zones over less than a 2.5 mm (0.1 in.) distance from the weld/base metal interface. The mechanical behavior response of local weldment microstructures can be characterized by simulation of the structure over larger usable volumes of material. This requires precise knowledge of the local thermal history during welding. An empirical equation for describing the thermal history of HT-9 weldment heat-affected zones during gas tungsten-arc welding is presented in this paper. Both peak temperatures and cool-down cycles, are predictable at any location in the base metal heat-affected zone for welding of plate under heat flow conditions similar to those anticipated for first wall component fabrication, i.e., two-dimensional heat flow. Power input and preheat effects are included in the equation. DOE

LEAKAGE FLOW-INDUCED VIBRATIONS FOR VARIATIONS OF A TUBE-IN-TUBE SLIP JOINT
T. M. Mulcahy Jan. 1986 39 p
(Contract W-31-109-eng-38)
(DE86-010765; ANL-86-11) Avail: NTIS HC A03/MF A01

Variations in the design of a specific slip joint separating two cantilevered, telescoping tubes conveying water were studied to determine their effect upon the leakage flow-induced vibration self-excitation mechanism known to exist for the original slip joint geometry. The important parameters controlling the self-excitation mechanism were identified, which, along with previous results, allowed the determination of a comprehensive set of design rules to avoid unstable vibrations. This was possible even though a new self-excitation mechanism was found when the engagement of the two tubes was small. DOE

DETERMINATION OF THE WEAR OF THERMOPLASTIC JOURNAL BEARINGS IN THE INITIAL STRAIN
Erich Frevert, Friedrich Franek, Robert Piringer, and Andreas Suschnig Jan. 1986 37 p In GERMAN; ENGLISH summary Presented at Seminar on Elektromechanische Konstruktionen, Vienna, Austria
(OEFZS-4345; IA-146/86; ESA-86-97247) Avail: NTIS HC A03/MF A01

The measurement of the wear of thermoplastic journal bearings using the radionuclide technique was investigated. The activation of the bearings can lead to changes in the molecular structure if it lasts too long. The wear of six activated bearings of one type was obtained in a fixed sequence and for given peripheries of the shaft. The amount of wear was calculated by comparing the radiation intensity of the wear probes with that of a standard specimen. The detection limit is 2 microg. In spite of the deviations of the single values caused by unequal loads on axis, the mean values show an indication of a bedding-in process up to 4000 m operating length followed by relatively constant wear. The simultaneous activation analysis of the probes shows that the proportionate distribution of the trace elements in the wear and thus in the surface layer of the bearings is different from the average distribution in the whole bearings. NONCONTACT MEASUREMENT OF ROUGHNESS OF GROUND AND POLISHED METAL SURFACES Final Report, Oct. 1983
Rainer Brodmann Bonn, West Germany BMFT Dec. 1985 26 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-T-85-150; ISSN-0340-7608; ESA-86-97438) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 5.50

An optical roughness measuring instrument consisting of a diode array and an optical system was used for noncontact roughness measurement based on the light scattering method. A microcomputer gives the roughness value, the intensity on the array, and the intensity distributions from the measured intensity values. The measurements can be performed on a static or mobile surface. The characteristics of the instrument are reviewed. Its applications to metal, semiconductor, ceramic, and plastic surfaces are presented. The optical roughness measuring instrument can be used as an automatic measuring station in mass production with synchronous parts feed and measurement recording. ESA

FACTORS THAT AFFECT RELIABILITY OF NONDESTRUCTIVE DETECTION OF FLAWS IN STRUCTURAL CERAMICS
S. J. Klima, G. Y. Baaklini (Cleveland State Univ., Ohio), and D. J. Roth 1986 11 p Presented at the 2nd International Symposium on Ceramic Materials and Components for Engines, Luebeck-Travemuende, West Germany, 14-17 Apr. 1986; sponsored by the German Ceramic Society and the American Ceramic Society
(NASA-TM-87348; E-3096; NAS 1.15:87348) Avail: NTIS HC A02/MF A01 CSCL 14D

The factors that affect reliability of nondestructive detection of flaws in structural ceramics by microfocus radiography and scanning laser acoustic microscopy (SLAM) were investigated. Reliability of void detection in silicon nitride and silicon carbide by microfocus X-rays was affected by photon energy level, material chemistry in the immediate vicinity of the void, and the presence of loose powder aggregates inside the void cavity. The sensitivity of SLAM to voids was affected by material microstructure, the level of porosity, and the condition of the specimen surfaces. Statistical results are presented in the form of probability of detection as a function of void diameter for green compacts and sintered materials. Author

QUANTITATIVE VOID CHARACTERIZATION IN STRUCTURAL CERAMICS USING SCANNING LASER ACOUSTIC MICROSCOPY
Don J. Roth, Edward R. Generazio, and George Y. Baaklini (Cleveland State Univ., Ohio) 1986 23 p Proposed for presentation at the Basic Science, Electronics and Glass Divisions Joint Meeting, New Orleans, La., 2-5 Nov. 1986; sponsored by American Ceramic Society
(NASA-TM-88797; E-3166; NAS 1.15:88797) Avail: NTIS HC A02/MF A01 CSCL 14D

The ability of scanning laser acoustic microscopy (SLAM) to characterize artificially seeded voids in sintered silicon nitride structural ceramic specimens was investigated. Using trigonometric relationships and Airy's diffraction theory, predictions of internal void depth and size were obtained from acoustic diffraction patterns produced by the voids. Agreement was observed between actual and predicted void depths. However, predicted void diameters were generally much greater than actual diameters. Precise diameter predictions are difficult to obtain due to measurement uncertainty and the limitations of 100 MHz SLAM applied to typical ceramic specimens. Author

A NEW RADIOGRAPHIC CORROSION INSPECTION CAPABILITY Final Report, 2 Jul. 1984 - 2 Jan. 1985
J. H. Stanley and J. J. LePage Jan. 1986 53 p
(Contract F33615-84-C-5089)
(AD-A167270; FR85-352-1; AFWAL-TR-85-4130) Avail: NTIS HC A04/MF A01 CSCL 14/5

A dual-energy radiographic technique is reported which could significantly enhance the corrosion detection and damage assessment capabilities of any radiometric system. Digital radiographs taken at two different effective energies are manipulated in such a way as to greatly improve the conspicuity of detail in the image by reducing the amount of structural noise present. The improved sensitivity offered by the method can be traded for an equivalent detectability at a much lower dose level, an important consideration for on-board or in-situ inspections. In addition, an important consideration when foreign material is present. Results indicate that the effective atomic number of unknown contaminants can be determined to better than 3% absolute error. ULTRASONIC INSPECTION OF PARTIALLY COMPLETED WELDS USING PATTERN RECOGNITION TECHNIQUES
N. M. Carlson and J. A. Johnson 1986 8 p Presented at the Quantitative NDE, Williamsburg, Va., 24 Jun. 1986
(Contract DE-AC07-76ID-01570)
(DE86-003227; EGG-M-27784; CONF-860639-1) Avail: NTIS HC A02/MF A01

The feasibility of using automated ultrasonic examination with computer-based pattern-recognition techniques to inspect partially completed welds on a pass-by-pass basis is investigated. In these tests welds are inspected, as they are being made, by an automated ultrasonic search unit attached to the weld head. Flaws are intentionally made in the weld. An analysis of the ultrasonic data collected during this process shows that the flaws can be reliably distinguished from good welds and, further, that two different types of flaws can be differentiated from each other. From this analysis a practical concurrent inspection system is shown to be feasible. DOE

DYNAMIC ANALYSIS: CORRELATION OF THEORY WITH EXPERIMENT Final Report
A. McLaughlin Jun. 1983 94 p
(Contract MODA26B/10)
(RP661; DYN/83/10; BR97157; ESA-86-97258) Avail: Issuing Activity

The NASTRAN finite element system with superelements was used to compute the normal modes of vibration and transfer functions of a helicopter. Using measured model damping factors, transfer functions in the cockpit and cabin areas for main rotor head shear and moment input were synthesized. Fair agreement in mode shape is obtained for the two NASTRAN analyses, but the correlation between the shake test modes and those from the WHL NASTRAN analysis is disappointing. The transfer function correlation is also poor, though better agreement with direct measurement is obtained for the transfer function synthesis from the WHL NASTRAN modes than for the corresponding synthesis from the measured mode shapes. The measured transfer functions could not be synthesized from the measured mode shapes. The aims of the study were not realized in full due to the poor quality of the results from the shake tests. THE DYNAMIC BEHAVIOR OF WIND TURBINE MASTS (IN THE FRAMEWORK OF WIND TURBINE DESIGN CRITERIA) [ONDERZOEK NAAR HET DYNAMISCH GEDRAG VAN WINDTURBINEMASTEN (IN HET KADER VAN ONTWERPCRITERIA WINDTURBINES)]
J. J. M. Albert, A. Waaldijk, and P. J. vanBrederode Oct. 1985 91 p In DUTCH Prepared for Nationaal Lucht- en Ruimtevaart Lab., Marknesse, Netherlands
(B-85-324; ESA-86-97771) Copyright. Avail: Issuing Activity

The dynamic behavior of wind turbine masts was measured and studied with a model in order to determine the eigenfrequencies. Measurements were performed on a wind turbine on a steel base (i.e., not on piles) and one on piles. The first is a Polenko windmill (type WPS16A60) with a height of 20m and a diameter of 16 m; the second is a Bouma windmill with a height of 25 m and a rotor diameter of 16 m. For the Polenko mill the measured values of the lowest eigenfrequency do not agree with the values predicted in the design; for the Bouma mill no prediction was available. The developed calculation model allows a good prediction of the lowest eigenfrequency for both types of wind turbine assemblies. The rotation spring constant of the foundation strongly effects the lowest eigenfrequency. ESA

INFLUENCE OF THIRD-DEGREE GEOMETRIC NONLINEARITIES ON THE VIBRATION AND STABILITY OF PRETWISTED, PRECONED, ROTATING BLADES
K. B. Subrahmanyam and K. R. V. Kaza May 1986 43 p
(NASA-TM-87307; E-2988; NAS 1.15:87307) Avail: NTIS HC A03/MF A01 CSCL 20K

The governing coupled flapwise bending, edgewise bending, and torsional equations are derived including third-degree geometric nonlinear elastic terms by making use of the geometric nonlinear theory of elasticity in which the elongations and shears are negligible compared to unity. These equations are specialized for blades of doubly symmetric cross section with linear variation of pretwist over the blade length. The nonlinear steady state equations and the linearized perturbation equations are solved by using the Galerkin method, and by utilizing the nonrotating normal modes for the shape functions. Parametric results obtained for various cases of rotating blades from the present theoretical formulation are compared to those produced from the finite element code MSC/NASTRAN, and also to those produced from an in-house experimental test rig. It is shown that the spurious instabilities, observed for thin, rotating blades when second degree geometric nonlinearities are used, can be eliminated by including the third-degree elastic nonlinear terms. Furthermore, inclusion of third degree terms improves the correlation between the theory and experiment. M.G.

LARGE DEFORMATION DYNAMIC BENDING OF COMPOSITE BEAMS Interim Report, Sep. 1983 - Apr. 1986
E. J. Derian (Global Analytics, Inc., San Diego, Calif.) and M. W. Hyer (Maryland Univ., College Park) Washington NASA Aug. 1986 218 p
(Grant NAG1-343)
(NASA-CR-4006; NAS 1.26:4006) Avail: NTIS HC A10/MF A01 CSCL 20K

Studies were conducted on the large deformation response of composite beams subjected to a dynamic axial load. The beams were loaded with a moderate eccentricity to promote bending. The study was primarily experimental but some finite element results were obtained. Both the deformation and the failure of the beams were of interest. The static response of the beams was also studied to determine potential differences between the static and dynamic failure. Twelve different laminate types were tested. The beams were loaded dynamically with a gravity driven impactor traveling at 19.6 ft/sec and quasi-static tests were conducted on identical beams in a displacement controlled manner. For laminates of practical interest, the failure modes under static and dynamic loadings were identical. Failure in most of the laminate types occurred in a single event involving 40% to 50% of the plies. However, failure in laminates with 30 deg or 15 deg off-axis plies occured in several events. All laminates exhibited bimodular elastic properties. Using empirically determined flexural properties, a finite element analysis was reasonably accurate in predicting the static and dynamic deformation response. Author

ZERO AND NEGATIVE MASSES IN FINITE ELEMENT VIBRATION AND TRANSIENT ANALYSIS Technical Summary Report
David S. Malkus and Michael E. Plesha Feb. 1986 31 p
(Contract DAAG29-80-C-0041)
(AD-A167489; MRC-TSR-2915) Avail: NTIS HC A03/MF A01 CSCL 12/1

Mass matrix lumping by quadrature is considered. Accuracy requirements seem to dictate the use of zero negative masses for multi-dimensional higher-order elements. It is shown that the zero and/or negative masses do not destroy the essential algebraic properties of the discrete eigen problems, in spite of the negative or infinite eigenvalues which may result. Explicit transient methods require positive definite lumping which, for some elements, may only be achieved by sacrificing accuracy to avoid the negative or zero masses that would render the lumping indefinite. An implicit-explicit time integration method based on quadratic triangles with optimal lumping is devised, analysed, and tested. It treats the nodes with nonzero masses explicitly and the nodes with zero masses implicitly. Analysis and numerical tests show that this

formulation is optimally accurate and less costly than a similar method with nonzero masses, based on optimally lumped biquadratic rectangles. The method is also found to be substantially more accurate than the fully explicit method based on lumping the triangular elements in an ad-hoc fashion to retain non-zero masses. Author (GRA)

AN INVESTIGATION INTO THE TRIPPING BEHAVIOR OF LONGITUDINALLY T-STIFFENED RECTANGULAR FLAT PLATES LOADED STATICALLY AND IMPULSIVELY M.S. Thesis
Howard L. Budweg Mar. 1986 101 p
(AD-A167718) Avail: NTIS HC A06/MF A01 CSCL 13/13

An experimental investigation was conducted to determine the static and dynamic responses of a specific stiffened flat plate design. The air-backed rectangular flat plates of 6061-T6 aluminum with an externally machine longitudinal narrow-flanged T-stiffener and clamped boundary conditions were subjected to static loading by water hydropump pressure and shock loading from and eight pound TNT charge detonated underwater. The dynamic test plate was instrumented to measure transient strains and free-field pressure. The static test plate was instrumented to measure transient strains, plate deflection, and pressure. Emphasis was placed upon forcing static and dynamic stiffener tripping, obtaining relevant strain and pressure data, and studying the associated plate-stiffener behavior. Author (GRA)

COMPOSITE STRUCTURAL RELIABILITY CALCULATION BY FINITE ELEMENT AND STATISTICAL STRENGTH THEORY M.S. Thesis
Pattama Suttisornyotin Mar. 1986 86 p
(AD-A167890) Avail: NTIS HC A05/MF A01 CSCL 20/11

The reliability of the structure can be calculated by combining the non-uniform stress distribution of a structure from finite element analysis with the statistical strength theory under two dimensional nonhomogeneous, uniaxial stress limitations. The specimen models with and without notch are the sample structures to illustrate the calculations. The statistical strength of the structure is cast in the standard Weibull form characterized by the structural scale parameter, Beta E and shape parameter, Alpha E which are functions of the material scale shape parameters (Alpha and Beta.) Therefore, this thesis demonstrated that the scale parameter of the structure remains constant for different load magnitude, only the structural geometry and loading condition cause the change of material scale parameter, Beta to the structural scale parameter, Beta E. The results also shows that the degree of uniformity of stress within structural element and the linearity of the load magnitude and stress distribution within the structure affect the accuracy for the calculation. STUDIES OF STRESS AND FATIGUE INDUCED DEFECTS USING SMALL ANGLE NEUTRON SCATTERING
J. R. Weertman 1985 11 p Presented at the Workshop on Atomic Transport and Defects in Metals By Neutron Scattering, Julich, West Germany, 2 Oct. 1985
(Contract DE-AC02-81ER-10960)
(DE86-004985; CONF-8510279-1) Avail: NTIS HC A02/MF A01

The technique of small angle neutron scattering (SANS) is proving to be of great value in the study of deformation-induced defects in various materials. Frequently SANS is the only practicable method for obtaining detailed, quantitative information on the kinetics of defect production. In crystalline material, the following defects produced by deformation are most amenable to study by SANS: bulk microcracking in brittle material; voids, bubbles and vacancy clusters; dislocations. If a broad definition is adopted for the types of defects to be considered, we can include the accelerated coarsening of particles and precipitates produced by high temperature deformation. To date the greatest success with SANS in the study of defects associated with stress has been achieved with cavities (voids, etc.) and microcracks. The presence of dislocations can be detected by neutron scattering, but more extensive data on their nature, disposition and density usually can be obtained readily by TEM examination of thin foils. Accordingly, emphasis in this review is on those defects for which neutron scattering has yielded detailed information not readily available by other methods. DOE

SWAY85: A COMPUTER PROGRAM FOR CALCULATING LUG AND SWAY BRACE LOADS
R. P. Rechard and P. K. Metzler Mar. 1986 88 p
(Contract DE-AC04-76DP-00789)
(DE86-009550; SAND-85-2178) Avail: NTIS HC A05/MF A01

The computer program, SWAY85, evaluates the lug and case loads on airborne stores (bombs, missiles, drop tanks) resulting from aircraft maneuvers and aerodynamic forces during flight according to the procedure suggested in the US military specification, MIL-A-8591G. This report describes the input and relations solved. SWAY85 uses input features (for example, control keywords along with a free-field reader) to make the code user-friendly and, consequently, less prone to input errors. In addition several data preparation aids are used. These aids include calculation of the dynamic pressure, interpolation of aerodynamic data, calculation of margins of safety if failure envelopes are supplied, and tabulation of up to 25 lowest margins of safety (or alternatively largest forces) for the sway braces and the forward and aft lugs. Furthermore, SWAY85 handles both large and small groups of data gracefully by permitting both ASCII and binary file input. DOE

INVESTIGATION OF ULTRASONIC METHODS FOR RESIDUAL STRESS MEASUREMENT
G. D. Swanson Apr. 1986 44 p
(Contract DE-AC04-76DP-00613)
(DE86-009614; BDX-613-3490) Avail: NTIS HC A03/MF A01

Three ultrasonic methods were investigated for nondestructively measuring residual stress in metals. Shear wave birefringence using a multiarticulated sample positioner and motorized transducer rotator was found to be very sensitive, but the results strongly depend on the matrial texture. Rayleigh wave measurements using a corner reflector and motorized goniometer have marginal sensitivity, but alternate methods using wedge, knife edge, or needle point contacts have sensitivity comparable to shear wave birefringence. The use of wave-propagation coefficients in conjunction with combinations of measurement methods appears to be at least as promising a technique as use of shear horizontal waves and promises to require much smaller transducers. FOUNDATIONS OF STATISTICAL CRACK MECHANICS
J. K. Dienes 1986 7 p Presented at the International Symposium on Intense Dynamic Loading and Its Effects, Beijing, China, 3 Jun. 1986
(Contract W-7405-eng-36)
(DE86-000764; LA-UR-85-3264; CONF-860616-5) Avail: NTIS HC A02/MF A01

The principle of superposition of elastic and plastic strain rates

in regions of plastic flow was hypothesized by Reuss in order to provide a smooth transition of the stresses between regions of elastic and elastic-plastic deformation. In this paper a generalization of this hypothesis is derived which allows for the formulation of more complex constitutive laws that can account for simultaneous plastic flow, fracture, fragmentation, and changes in porosity. Such processes can occur during impact, explosions and earthquakes. The possibility of analyzing such processes by finite element methods has been made possible by the advent of large scale computers, but most practioners agree that more general constitutive laws are required to account adequately for the complex flow processes involved. TECHNIQUE FOR MEGABAR CONTROLLED STRAIN EXPERIMENTS
K. P. Staudhammer and K. A. Johnson 1986 7 p Presented at the International Symposium on Intense Dynamic Loading and its Effects, Beijing, China, 3 Jun. 1986
(Contract W-7405-eng-36)
(DE86-000805; LA-UR-85-3389; CONF-860616-4) Avail: NTIS HC A02/MF A01

This design allows in one shot one experiment a range of pressures from 12 to 170 GPa and a selectable strain range (0 to 55%) in 304 stainless steel with 100% recovery. Development of the application of griding has enabled correlation, locally, of pressure and strain with structure and properties at a strain rate of 10(6)/s. Appropriate variations in momentum trap design can control strain in cylindrical implosion shock experiments. Pedestal type traps have shown significant improvement in the reduction of strain in cylindrical implosion experiments. Such design would seem to be appropriate for experiments on brittle and ceramic materials. In cylindrical designs the degree of macro-strain is a function of trapping and is the result of reflected waves not the primary shock pulse. DOE

X-RAY LINE PROFILE ANALYSIS OF SHOCK-MODIFIED COMPOUNDS
B. Morosin, R. A. Graham, Y. Zhang, and J. M. Stewart 1986 8 p Presented at the International Symposium on Intense Dynamic Loading and its Effects, Beijing, China, 3 Jun. 1986 Prepared in cooperation with Maryland Univ., College Park
(Contract DE-AC04-76DP-00789)
(DE86-003454; SAND-85-2412C; CONF-860616-7) Avail: NTIS HC A02/MF A01

The overall assessment revealed by the extensive studies show that large plastic deformation as evidenced by residual lattice strain is introduced at peak pressures of 7.5 GPa or lower. For various refractory materials, both coherent domain size and residual lattice strain depend strongly on shock conditions (pressure and temperature) and on specific material properties. There is evidence for defect configurations which differ from those produced by more conventional methods. The high residual strain values resulting from the large intense plastic deformation on these normally brittle refractory materials are more typical of those determined in heavily cold worked metals. The behavior is consistent with the unusual nature of the shock deformation process. Such shock-modified materials have been shown to exhibit increased chemical reactivity in a manner that should influence material processing procedures. DOE

ANALYSIS OF THE FELIX EXPERIMENTS WITH CANTILEVERED BEAMS AND HOLLOW CYLINDERS
L. R. Turner, T. Q. Hua, and S. Y. Lee 1986 44 p Presented at the 4th Eddy Current Seminar, Chilton, England, 24 Mar. 1986
(Contract W-31-109-eng-38)
(DE86-010528; CONF-8603116-1) Avail: NTIS HC A03/MF A01

Experiments have been performed with the FELIX facility at Argonne National Laboratory to study the coupling between eddy currents and deflections and to provide data for validating eddy current computer programs. Experiments with cantilevered beams in crossed steady and decaying magnetic fields verify that coupling effects act to alleviate the large currents, deflections, and stresses predicted by uncoupled analyses. Measurements of magnetic fields induced in conducting hollow cylinders are analyzed by exponential fitting and by transfer functions. Spatial variation in the parameters of the exponential fit and in those of the one- and two-pole transfer functions suggests that several eddy current modes are acting in the cylinder test pieces. FINITE ELEMENT ANALYSIS TO EVALUATE THE STRESS DISTRIBUTION AND THE ENERGY RELEASE RATE AT THE CRACKING FRONT OF A FRACTURE MECHANICS SPECIMEN FOR LINEAR AND NONLINEAR MATERIAL BEHAVIOR [FINITE-ELEMENT-ANALYSE ZUR BEURTEILUNG DER SPANNUNGSVERTEILUNG UND ENERGIEFREISETZUNGSRATE AN DER RISSSPITZE EINER BRUCHMECHANIKPROBE BEI LINEAREM UND NICHTLINEAREM MATERIALVERHALTEN]
R. Dietrich 2 Dec. 1985 63 p In GERMAN; ENGLISH summary
(GKSS-85/E/54; ISSN-0344-9629; ESA-86-97410) Avail: NTIS HC A04/MF A01

The distribution of stresses and the energy release rate near the cracking front of specimen and component welded underwater were analyzed using a finite element method in order to predict their loading capacity. The incremental continuum mechanics equations of motion are formulated. The finite element discretization and the numerical solution of the finite element equations (modified Newton-Raphson iteration and Broyden-Fletscher-Goldbard-Shanno method) are explained. The linear and nonlinear material behavior of a fracture mechanics specimen was investigated. It is shown that theory and calculation programs provide information about the structural-mechanics behavior of the specimen if, in the presence of welding internal stresses and loading stresses, statements about stress intensity factors calculated from the J-integral have to be taken into account. SOLUTION OF THE PROBLEM OF ELASTOPLASTIC TORSION WITH A FINITE ELEMENT METHOD [OPLOSSING VAN HET PROBLEEM VAN DE ELASTOPLASTISCHE TORSIE MET EEN EINDIGE ELEMENTEN METHODE]
J. M. F. Peters Aug. 1984 119 p In DUTCH
(ESA-86-97546) Avail: NTIS HC A06/MF A01

The problem of the elastoplastic torsion of a cylindrical bar made of an ideal-plastic, homogenous, isotropic material, was solved using a numerical method. A variational formulation was applied to eliminate the interface between the elastic and plastic area. Only the gradient of the stress function, i.e., the sectional shear stress, occurs as a variable in this formulation, introducing a divergence freedom condition. Using a finite element method, stress components were approximated by constant functions. The obtained convex minimization problem was solved with a saddle

point algorithm for an appropriate Lagrangian, in which only the inequality limitations were accounted for. Numerical results show a very slow convergence of the optimization algorithm (especially for the finer distributions). A more efficient solution for a bar with certain symmetry characteristics is discussed. ESA

N86-31936# Societe Nationale Industrielle Aerospatiale, Les Mureaux (France).
USE OF A SPECIAL FINITE ELEMENT FOR THE STATIC ANALYSIS OF NORMAL INTERFACIAL STRESSES
Gilles Bourdeau 1986 18 p In FRENCH; ENGLISH summary Presented at DRET Conference at Tendances Actuelles en Calcul des Structures, Bastia, France, 6-8 Nov. 1985
(SNIAS-861-422-109; ESA-86-97597) Avail: NTIS HC A02/MF A01

A finite element is defined following Hellinger-Reissner's variational principle and Verchery's idea. The normal interface stresses become nodal unknowns, which supplies a better estimation of their value. A function is obtained and applied to axisymmetric problems and orthotropic materials. For the partition in finite elements, an isoparametric element is used. The meridian line is an eight node quadrilateral. Two computations having a known analytical solution are used to test the method. It is shown that the proposed element is very helpful when a displacement method is used. ESA

ELASTOPLASTIC TORSION OF A CYLINDRICAL BEAM, DESCRIBED BY VARIATIONAL INEQUALITIES [ELASTOPLASTISCHE TORSIE VAN EEN CYLINDRISCHE BALK, BESCHREVEN MET BEHULP VAN VARIATIONELE ONGELIJKHEDEN]
J. J. E. IndenKleef Apr. 1984 103 p In DUTCH
(ESA-86-97704) Avail: NTIS HC A06/MF A01

The elastoplastic torsion problem of a cylindrical beam was investigated. The method of variational inequalities was applied to solve this minimalization free boundary problem. The problem was discretized to allow a numerical solution using the finite element method. The numerical solution is based on the method of (over) relaxation with projection. One variational inequality contains simple constraints, the other inequality contains difficult constraints, so-called gradient constraints. Due to these conditions existing finite element packages could not be used; the method had to be implemented using simple elements and linear approximations. Estimates for the discretization errors due to the approximations are given. The numerical solution shows that theoretically deduced error estimates are not optimal. ESA

STABILITY OF A RUBBER HALF-SPACE, PART 2
P. Meijers Jul. 1985 60 p
(WTHD-176-Pt-2; Rept-793-Pt-2; ESA-86-97711-Pt-2) Avail: NTIS HC A04/MF A01

The effect of buckling modes on the buckling behavior of a rubber half space in the neighborhood of the bifurcation point was studied. It turns out that the line of steepest descent in the postbuckling behavior becomes increasingly steeper as an increasing number of buckling modes are added. This suggests that the retaining of third order terms of the potential energy function alone yields solutions which are valid only in a very small neighborhood of the bifurcation point. Fourth order terms in the asymptotic expansion are needed to extend the region where the solution yields a sufficiently accurate approximation. But routine inclusion of the fourth order terms leads to singular solutions at the critical load owing to the contributions of the remaining buckling modes. A way to get around this difficulty is indicated. ESA

Results of research in the remote sensing of natural boreal forest vegetation (the COVER project) are summarized. The study objectives were to establish a baseline forest test site; develop transforms of LANDSAT MSS and TM data for forest composition, biomass, leaf area index, and net primary productivity; and perform tasks required for testing hypotheses regarding observed spectral responses to changes in leaf area index in aspen. In addition, the transfer and documentation of data collected in the COVER project (removed from the Johnson Space Center following the discontinuation of Earth resources research at that facility) is described. (Grant NAG5-289)
(NASA-CR-177175; NAS 1.26:177175) Avail: NTIS HC A03/MF A01 CSCL 05B

Oceans are data-sparse areas in terms of conventional weather observations. The surface pressure field obtained solely by analyzing the conventional weather data is not expected to possess high accuracy. On the other hand, in entering asynoptic data such as satellite-derived temperature soundings into an atmospheric prediction system, an improved surface analysis is crucial for obtaining more accurate weather predictions because the mass distribution of the entire atmosphere will be better represented in the system as a result of the more accurate surface pressure field. In order to obtain improved surface pressure analyses over the oceans, a variational adjustment technique was developed to help blend the densely distributed surface wind data derived from the SEASAT-A radar observations into the sparsely distributed conventional pressure data. A simple marine boundary layer scheme employed in the adjustment technique was discussed. In addition, a few aspects of the current technique were determined by numerical experiments. Author

LANDSAT thematic mapper (TM) data are being used to refine and validate a stochastic spatial computer model to be applied to coastal resource management problems in Louisiana. Two major aspects of the research are: (1) the measurement of area of land (or emergent vegetation) and water and the length of the interface between land and water in TM imagery of selected coastal wetlands (sample marshes); and (2) the comparison of spatial patterns of land and water in the sample marshes of the imagery to that in marshes simulated by a computer model. In addition to activities in these two areas, the potential use of a published autocorrelation statistic is analyzed. Author

LANDSAT-4 AND LANDSAT-5 MULTISPECTRAL SCANNER COHERENT NOISE CHARACTERIZATION AND REMOVAL
James C. Tilton and William L. Alford, principal investigators (Defense Mapping Agency, Washington, D.C.) May 1986 46 p Original contains color illustrations
(NASA-TP-2595; Rept-86B0040; NAS 1.60:2595) Avail: NTIS HC A03/MF A01 CSCL 14B

A technique for characterizing the coherent noise found in LANDSAT-4 and LANDSAT-5 multispectral scanner (MSS) data is described along with a companion technique for filtering out the coherent noise. The techniques are demonstrated on LANDSAT-4 and LANDSAT-5 MSS data sets, and explanations of the noise pattern are suggested. A cookbook procedure of characterizing and filtering the coherent noise using special NASA/Goddard IDIMS functions is included. Also presented are analysis results from the retrofitted LANDSAT-5 MSS sensor which shows that the coherent noise has been substantially reduced. Author

A PROPOSAL FOR THE DEVELOPMENT OF A LARGE-SCALE TOPOGRAPHIC-CARTOGRAPHIC DATA BASE TAKING THE PLANIMETRIC DATA OF AUTOMATED CADASTRAL MAP (ALK) SYSTEM INTO ACCOUNT [EIN VORSCHLAG ZUM AUFBAU EINER GROSSMASSTAEBIGEN TOPOGRAPHISCH-KARTOGRAPHISCHEN DATENBANK UNTER BESONDERER BERUECKSICHTIGUNG DER GRUNDRISSDATEI DES ALK-SYSTEMS]
Dietmar Gruenreich *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 55-70 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

The database system developed in computer-assisted production, revision and use of cadastral maps in digital form is used to establish a large-scale topographic-cartographic data base (1:5,000). Cadastral maps with 70% of the planimetric information of topographic maps are one of the most important sources for the conventional production and revision of the German Basic Map 1:5,000 (DGK 5). A digital data interconnection system between digital cadastral maps (ALK) and the Digital Landscape Model 1:5,000 (DLM 5) is proposed. A graph theory-based procedure for automatic generalization of digital cadastral maps is described. Topographic information which can not be derived from cadastral maps is to be gained using digital photogrammetric procedures and linked to the ALK data. Applications in geosciences, spatial planning, and cartographic generalization for small-scale DLM are shown. ESA

HARDWARE FOR DATA BANKS IN CARTOGRAPHY: CONCEPTS [HARDWARE FUER DATENBANKEN IN DER KARTOGRAPHIE: KONZEPTE]
Horst Kremers *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 71-89 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

Computer architectures suitable for work with data bank systems are presented. Hardware and software aspects are treated together in large systems for application of special processors and memories which can increase the system efficiency. Concepts applicable in design and function of modules of a data base computer for cartographic applications are reviewed. The use of dedicated hardware components can contribute to system optimization. Mutual software and hardware dependencies lead to feedback in design. Expert systems and ergonomical applications supported by subject-related artificial intelligence can be created by applying such special data bank computers in cartography. ESA

NEW ARRAY PROCESSORS OF FLOATING POINT SYSTEMS [NEUE ARRAY-PROZESSOREN VON FLOATING POINT SYSTEMS] c60
Bernd Lauer *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 101-105 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

The array processor series FPS-5000 increases the computation capacity required for digital signal and image processing at low cost. It is used for demodulation/signal analysis, CT processing, multispectral classification, 2D complex Fast Fourier Transformation (FFT), matrix multiply. The array processor of floating point systems is made of a concentration of VLSI circuits and can be connected to a host computer. A typical FPS-5000 system consists of a control processor, arithmetic coprocessors, a system common memory and input/output processors. It allows a computation capacity of up to 62 million floating point operations/sec. ESA

REPRODUCTION OF TOPOGRAPHIC MAP 1:200000 IN DIGITAL RASTER MODE [REPRODUKTION DER TOPOGRAPHISCHEN UEBERSICHSTKARTE 1:200000 IM DIGITALEN RASTERMODUS]
Heinz Meurisch and Wigand Weber *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 107-114 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

Reproduction of a photographic map 1:200,000 in primary and mixed color print by digital raster techniques is reported. Digital raster technique is based on transformation of a map into a matrix of quadratic raster points or pixels using an electronic data processing system. The operational steps of data acquisition, preparation of printing and production of printing film in digital raster mode are explained and time requirements are given. Results show improvement compared to the conventional photomechanical process. Digital raster mode can not be applied economically for reproduction of mixed and primary color printing due to high time requirements. ESA

CALCULATION AND REPRESENTATIONS OF ELEVATION CHANGES IN A TIDAL FLAT AREA FROM DIGITAL TERRAIN MODELS [BERECHNUNG UND DARSTELLUNG VON HOEHENVERAENDERUNGEN IM WATT AUS DIGITALEN GELAENDEMODELLEN]

Hartmut Rosengarten *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 125-133 In GERMAN; ENGLISH summary Original contains color illustrations (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

The tidal flat areas along the German North Sea coast subjected to large changes by the influence of tide and extreme meteorological conditions are studied to protect man against sea intrusions and hazards. The tidal flat areas are studied using electronic tachymetry, photogrammetry with water line procedures, hydrographic measurements and through aerial photograhy. The data are stored in a data bank and used to calculate elevation changes in tidal flat areas and improve the information on topographic maps. The cartographic representation of elevation changes is described. Map production through increased automation of the partial processes in map design and in reproduction can be economically applied. ESA

DIGITAL ELEVATION FOR THE BADEN-WURTTEMBURG LAND (WEST GERMANY) [DAS DIGITALE HOEHENMODELL FUER DAS LAND BADEN-WUERTTEMBERG]
Manfred Sigle *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 143-154 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

For an area covering 36,000 sqkm, vertical profiles are recorded analogously, 80 m apart, on storage plates for orthoprojector operation. The profiles are digitized and used for the interpolation of a digital elevation model in the form of a 50 m grid. Interpolation, storage and application of the digital elevation model are achieved through program SCOP allowing a processing capacity of 100,000 terrain points. Processing of the 16 million profile points with correction of systematic data errors is described. The computation cost of the digital elevation model is discussed. ESA

N86-31959# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
A SOFTWARE CONCEPT FOR INTERACTIVE LETTER LOCATION THROUGH DIGITAL IMAGE PROCESSING [EIN SOFTWAREKONZEPT ZUR INTERAKTIVEN SCHRIFTPLAZIERUNG MITTELS DIGITALER BILDVERARBEITUNG] c61
Ulrich Theissing *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 155-162 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

A system which allows the interactive location of letters and meets cartographic requirements is presented. For representation of the letter on the screen an image resolution of two lines per millimeter is applied. An example is produced with a system core already implemented to study its feasibility. Results show good quality of the letter and that the program should be improved by progressive integration of signature location and map frame and map boundary representation. ESA

N86-31960# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
DIGITAL GEOSCIENTIFIC CARTOGRAPHY: A LEADING PROGRAM OF THE GERMAN RESEARCH COMMUNITY [DIGITALE GEOWISSENSCHAFTLICHE KARTENWERKE - EIN NEUES SCHWERPUNKTPROGRAMM DER DEUTSCHEN FORSCHUNGSGEMEINSCHAFT]
Renier Vinken *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 163-173 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

Computer techniques for the survey, design, production and evaluation of geoscientific maps are presented. Preparation and utilization of the terrain data, laboratory and remote sensing data, the development of geoscientific basic maps and evaluation maps, updating of the basic data and continuity of geoscientific cartography are included. Data acquisition and preparation, data transfer, storage and management, data processing and data retrieval and automated cartography are included. Economical application of graphical interactive screens, control and processing computers and image machines in geoscientific mapping are discussed. ESA

THREE-DIMENSIONAL VIEWS OF CARTOGRAMS IN DIGITAL RASTER MODE [SCHEINPLASTISCHE DARSTELLUNGEN VON KARTOGRAMMEN IN DIGITALEN RASTERMODUS]
Wigand Weber *In its* Reports on Cartography and Geodesy. Series 1: Original Reports, No. 95 1985 p 175-189 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

A digital raster method for producing three-dimensional views of cartograms (choropleth maps) and layered maps of real or thematic mountainous regions (continuous phenomena) is outlined. The three-dimensional view is achieved either by (a) oblique parallel projections of imagined prisms (cylinders) or stepped cones of different height onto a vertical plane taking hidden areas into consideration (hidden-surface removal) or (b) by producing a stereo mate to the parallel projection from (a). System (a) consists in successively moving up the thematic areas or hypsometric layers to their final level while erasing previously generated elements of representation. In this procedure an algorithm operating on a hierarchic basis can save much computing time. The stereo mate according to (b) is formed by repeating the process after slightly changing the given direction of view. ESA

CAPIR/DEM: A COLLECTION SYSTEM FOR GEOGRAPHICALLY BASED DIGITAL ELEVATION DATA

J. Hutchings, B. Kiracofe, G. Nash, H. Niedzwiadek, and Dan Edwards Dec. 1985 20 p
(AD-A167471; ETL-R-088) Avail: NTIS HC A02/MF A01 CSCL 08/2

Digital grid-point elevation models are a widely distributed and applied source of digital topographic data. DEMs are commonly used to generate planimetric contour, slope, or aspect maps and are often merged with other sources of data for sophisticated modeling and systems applications. DEMs cover either large land areas at a course resolution or very limited sites at high resolution. Emerging technology in such diverse areas as robotics, computer image generation, and computer simulation will require timely, cost effective custom DEM data. This paper details a system designed to meet these impending future requirements for DEM (Digital Elevation Models). A collection system for DEMs using an adaptive spacing grid is used to optimize resources when collecting DEMs in areas that have wide variations in relief. Future enhancements are proposed to provide adjustments between data collected during separate sessions and to densify existing DEM data to a higher resolution. GRA

INVESTIGATION OF POLAR MOTION FROM DOPPLER TRACKING OF THE NNSS (NAVY NAVIGATION SATELLITE SYSTEM) DURING THE MERIT CAMPAIGN Final Report
William H. Wooden, John A. Bangert, and J. M. Robinson Apr. 1986 18 p Presented at the 4th International Geodetic Symposium on Satellite Positioning, Austin, Tex., 23 Apr. - 2 May 1986
(AD-A167565) Avail: NTIS HC A02/MF A01 CSCL 03/1

For more than a dozen years, Doppler tracking of the Navy Navigation Satellite System (NNSS) has demonstrated the ability to give solutions for polar motion as a byproduct of precise ephemerides generation. This paper reviews the polar motion estimation process at the Defense Mapping Agency from Doppler measurements of the NNSS and gives comparisons to polar motion series from newer observational techniques and to the Bureau International del'Heure Circular-D series. The different techniques are compared for the period of the MERIT Main Campaign. In addition to comparing results for the Nova and Oscar NNSS satellites, comparisons are done utilizing the WGS 84 and the NWL 9Z2 gravitational fields in the precise ephemerides generation process. NORDA ARCTIC DATA COLLECTION, PROCESSING AND INTERPRETATION CAPABILITIES Final Report
Duane T. Eppler and Jeffrey D. Hawkins Sep. 1985 26 p
(AD-A167797; NORDA-129) Avail: NTIS HC A03/MF A01 CSCL 08/12

The Special Sensor Microwave/Imager (SSM/I) will provide the Navy with the global capability to measure sea ice, wind speed, water vapor, rain rate, and several other atmospheric parameters. The sea ice retrievals will go a long way toward filling a present gap in analysis data sets. Thus, proper validation of this sensor's abilities is required if the full potential is to be achieved. Naval Ocean Research and Development Activity (NORDA) personnel have access to a number of ground, aircraft, and spaceborne instruments that can contribute to SSM/I sea ice validation efforts. Ice camps, the K-band Radiometric Mapping System (KRMS), and satellite visible and infrared data can all provide a piece of the puzzle when addressing the issue of algorithm performance. It is essential to include ground, air, and spaceborne resources to tackle the task of validating the sea ice information retrieved from SSM/I data. Not only must we cover large geographic regions synoptically, but we must also be able to discern smaller irregularities found within the SSM/I cell footprints. Only then can we push algorithms to their required limits. GRA

APPLICATION OF MULTIPLE LINES OF POSITION FOR HYDROGRAPHY M.S. Thesis
Samuel P. DeBow, Jr. Mar. 1986 124 p
(AD-A167884) Avail: NTIS HC A06/MF A01 CSCL 17/7

Conventional near-shore large-scale hydrographic surveys use only two lines of position (LOPs) for position fixing. Previous works have proved that accuracies needed to meet the present International Hydrographic Organization standards are frequently not achieved using conventional surveying methods. The concept of using multiple lines of position (MLOP) adjusted by the least squares method was described. Actual field measurements acquired in the autumn of 1984 were processed to ascertain the increase in accuracy using MLOP versus conventional two LOPs on each hydrographic position. Recommendations are to use a four-range fully automated position-fixing method to increase production, improve data quality, and have better control of the survey operations. GRA

THE USGS (US GEOLOGICAL SURVEY) X-, C-, AND L- BAND SAR DATA COLLECTION PROGRAM Topic Report, Nov. 1983 - Aug. 1985
Eric S. Kasischke Aug. 1985 121 p
(Contract DI-14-08-0001-21748)
(AD-A168173; ERIM-173000-4-T) Avail: NTIS HC A06/MF A01 CSCL 17/9

This report presents the results of data collection program performed for the U.S. Geological Survey. Twenty-two passes of high resolution (3m), multifrequency (X-, C- and L-band) and multipolarization (VV and VH) imagery were collected over five test sites within the North Carolina Digital Project Area. The SAR used for this program was the ERIM/CCRS CV-580 SAR System. This report presents diagrams of the ground swath of each SAR pass, along with representative SAR imagery which illustrates the high quality of the data set. The engineering assessment performed on the SAR imagery is discussed. The optical and digital SAR data products generated for this program are summarized, including the first-order geometric and radiometric corrections applied to the digital data. GRA

DIGITAL PROCESSING OF LANDSAT TM IMAGES FOR LINEAMENT OCCURRENCE AND SPATIAL FREQUENCY IN SEDIMENTARY ROCKS
G. K. Moore and D. A. Hastings 1986 33 p
(Contract DE-AI05-85OR-21552)
(DE86-009834; DOE/OR-21552/1) Avail: NTIS HC A03/MF A01

This report describes and evaluates procedures for the enhancement and extraction of lineament segments by computer processing of digital Landsat Thematic Mapper data. Nearly all results were obtained by convolution of filter windows in the spatial domain. During the course of the study several new procedures were developed for image enhancement, directional enhancement, and the extraction of edge and line segments from directionally-filtered images. The standard procedure proved satisfactory for an extraction of prominent edges and lines in the Landsat images. Part of the problem is caused by the landscape and illumination characteristics of the selected images, but another part is caused by the fact that many boundaries are gradational and do not fit a simple mathematical description of edges and lines. Because of this problem, extraced segments in shale outcrop areas were not compared with those in other types of sedimentary rocks, and measurements of the spatial frequency of occurrence of these segments have a questionable value. A possible solution to the problems found by this study would be: (1) to use a combination of digital elevation data and digital remotely-sensed data of the same area; and (2) to combine directional enhancement and lineament segment extraction with visual detection, screening, and editing. DOE

CALIBRATION OF MULTISPECTRAL SCANNER (MSS) SATELLITE DATA TO EVALUATE CHANGE IN THE REFLECTION OF CONIFEROUS STOCKS
Gerd-Peter Fehlert Nov. 1985 180 p Original language document was announced as N86-10636
(ESA-TT-938; DFVLR-FB-84-44; ESA-86-97575) Avail: NTIS HC A09/MF A01; original German version available from DFVLR, Cologne, West Germany DM 71

A relative calibration was performed in order to allow a comparative, multitemporal analysis of MSS satellite data and hence the detection of reflectory changes with regard to selected object classes. By applying the method to the class wood, the age of a coniferous stock can be determined, and during the stage of growth distinct age groups show locally differing reflection properties. The latter suggests disorders of the proliferation of young sprouts. This method can be an early indicator for the detection of damaged forest areas. The atmospheric influence on satellite data was determined by a multilayer atmospheric model. ESA

MOISTURE DETERMINATIONS IN AND UNDER VEGETATION CANOPIES
G. P. deLoor Jul. 1985 50 p Sponsored by Dutch Remote Sensing Board
(FEL-1985-52; ESA-86-97770) Avail: NTIS HC A03/MF A01

Using the vegetation model of Attema and Ulaby (1978) the possibilities of moisture determinations in a canopy, and of the soil under it, with radars of different frequencies are investigated. The moisture determinations require lower frequencies (C-band and lower). Soil moisture and vegetation moisture determinations require different incidence angles (10 to 20 deg, and > 30 deg respectively). For frequencies in the X-band and higher, the canopy becomes opaque for the radar waves and the backscatter becomes dependent on the moisture distribution in the canopy (plant architecture). This makes classification (incidence angles 40 deg) easier and possibly also the detection of changes in plant architecture due to stress. ESA

PROSPECTS FOR SMALL AND MARGINAL FARMERS IN TRICHY DISTRICT (TAMIL NADU, INDIA) TO USE WATER PUMPING WINDMILLS FOR IRRIGATION
Peter Goedhart May 1984 136 p Sponsored by Humanistic Institute for Cooperation with Developing Countries
(ESA-86-97721) Avail: Issuing Activity

The economic, technical, and agricultural aspects of equiping poor farmers in India with windpowered pumps were analyzed. It is concluded that the prospects for a market for windmills among nontarget group farmers (especially big farmers with diesel pumps) are better than the prospects among the target group farmers. Continuation of the project might lead to an improvement of the situation for the richer farmers, which would in turn lead to a decline in the situation of the original target group of the project, the small and marginal farmers. ESA

PARAMETRIC AND CYCLE TESTS OF A 40-A-HR BIPOLAR NICKEL-HYDROGEN BATTERY
Robert L. Cataldo 1986 12 p Presented at the 21st Intersociety Energy Conversion Engineering Conference (IECEC), San Diego, Calif., 25-29 Aug. 1986; sponsored by ACS, SAE, ANS, ASME, IEEE, AIAA and AIChE
(NASA-TM-88793; E-3102; NAS 1.15:88793) Avail: NTIS HC A02/MF A01 CSCL 10C

A series of tests was performed to characterize battery performance relating to certain operating parameters which included charge current, discharge current, temperature and pressure. The parameters were varied to confirm battery design concepts and to determine optimal operating conditions. Spacecraft power requirements are constantly increasing. Special spacecraft such as the Space Station and platforms will require energy storage systems of 130 and 25 kWh, respectively. The complexity of these high power systems will demand high reliability, and reduced mass and volume. A system that uses batteries for storage will require a cell count in excess of 400 units. These cell units must then be assembled into several batteries with over 100 cells in a series connected string. In an attempt to simplify the construction of conventional cells and batteries, the NASA Lewis Research Center battery systems group initiated work on a nickel-hydrogen battery in a bipolar configuration in early 1981. Features of the battery with this bipolar construction show promise in improving both volumetric and gravimetric energy densities as well as thermal management. Bipolar construction allows cooling in closer proximity to the cell components, thus heat removal can be accomplished at a higher rejection temperature than conventional cell designs. Also, higher current densities are achievable because of low cell impedance. Lower cell impedance is achieved via current flow perpendicular to the electrode face, thus reducing voltage drops in the electrode grid and electrode terminals tabs. Author

EFFECT OF IMPREGNATION METHOD ON CYCLE LIFE OF THE NICKEL ELECTRODE
John J. Smithrick 1986 9 p Presented at the 21st Intersociety Energy Conversion Engineering Conference (IECEC), San Diego, Calif., 25-29 Aug. 1986; sponsored by ACS, SAE, ANS, ASME, IEEE, AIAA and AIChE
(NASA-TM-87326; E-3037; NAS 1.15:87326) Avail: NTIS HC A02/MF A01 CSCL 10C

The nickel electrode has been identified as the life limiting component for individual pressure vessel (IPV) nickel-hydrogen cells when cycled under a low earth orbit (LEO) cycle regime at deep depths of discharge. As a part of an overall program to develop a long life nickel electrode for nickel-hydrogen cells, the effect of two different methods of electrochemical impregnation on the cycle life of the nickel electrode was investigated. One method was the Pickett (aqueous/ethanolic) process. The other was the modified Bell (aqueous) process. The plaques for both impregnation methods were made by sintering dry carbonyl nickel powder in a reducing atmosphere. The plaques contain a nickel screen substrate. Electrodes made from both processes were cycle tested in Air Force design IPV nickel-hydrogen cells. The only factor different for this test was the method of plaque impregnation; all other factors were the same. The cells were cycled to failure under a 90 min LEO cycle regime at a deep depth of discharge (80 percent DOD). Failure for this test was defined to occur when the cell voltage degraded to 1.0 V prior to the completion of the 35 min discharge. Author

DESIGN CONSIDERATIONS FOR ADVANCED BATTERY CONCEPTS
Harold F. Leibecki and Lawrence H. Thaller 1986 16 p Presented at the 3rd Space Systems Technology Conference, San Diego, Calif., 9-12 Jun. 1986; sponsored by the American Institute of Aeronautics and Astronautics Previously announced in IAA as A86-40579
(NASA-TM-87319; E-3055; NAS 1.15:87319) Avail: NTIS HC A02/MF A01 CSCL 10C

A mathematical representation for the charge and discharge of a sodium-sulfur cell is developed. These equations are then used as the basis for a computerized model to examine the effects of cell arrangement in the design of a large multi-kilowatt battery from a group of hypothetical individual cells with known variations in their ampere hour capacity and internal resistance. The cycling characteristics of 216 individual cells arranged in six different configurations are evaluated with the view towards minimizing the adverse effects that are introduced due to the stoichastic aspects of groupings of cells, as well as the possibility of cell failures in both the open and shorted mode. Although battery systems based on sodium-sulfur cells are described in this example, any of the newer electrochemical systems can be fitted into this framework by making appropriate modifications to the basic equations. ESTIMATED HEATS OF FUSION OF FLUORIDE SALT MIXTURES SUITABLE FOR THERMAL ENERGY STORAGE APPLICATIONS
Ajay K. Misra (Case Western Reserve Univ., Cleveland, Ohio.) and John D. Whittenberger May 1986 26 p
(NASA-TM-87320; E-3057; NAS 1.15:87320) Avail: NTIS HC A03/MF A01 CSCL 10A

The heats of fusion of several fluoride salt mixtures with melting points greater than 973 K were estimated from a coupled analysis of the available thermodynamic data and phase diagrams. Simple binary eutectic systems with and without terminal solid solutions, binary eutectics with congruent melting intermediate phases, and ternary eutectic systems were considered. Several combinations of salts were identified, most notable the eutectics LiF-22CaF2 and NaF-60MgF2 which melt at 1039 and 1273 K respectively which posses relatively high heats of fusion/gm (greater than 0.7 kJ/g). Such systems would seemingly be ideal candidates for the light weight, high energy storage media required by the thermal energy storage unit in advanced solar dynamic power systems envisioned for the future space missions. SUMMARY OF NASA/DOE AILERON-CONTROL DEVELOPMENT PROGRAM FOR WIND TURBINES Final Report
Dean R. Miller 1986 26 p Presented at the Energy-Sources Technology Conference and Exhibition, New Orleans, La., 23-28 Feb. 1986; sponsored by American Society for Mechanical Engineers
(Contract DE-AI01-76ET-20320)
(NASA-TM-88811; DOE/NASA-20320/71; E-3163; NAS 1.15:88811) Avail: NTIS HC A03/MF A01 CSCL 10A

The development of aileron-control for wind turbines is discussed. Selected wind tunnel test results and full-scale rotor test results are presented for various types of ailerons. Finally, the current status of aileron-control development is discussed. Aileron-control was considered as a method of rotor control for use on wind turbines based on its potential to reduce rotor weight and cost. Following an initial feasibility study, a 20 percent chord aileron-control rotor was fabricated and tested on the NASA/DOE Mod-0 experimental wind turbine. Results from these tests indicated that the 20 percent chord ailerons regulated power and provided overspeed protection, but only over a very limited windspeed range. The next aileron-control rotor to be tested on the Mod-0 had 38 percent chord ailerons and test results showed these ailerons provided overspeed protection and power regulation over the Mod-0's entire operational windspeed range. INSTALLATION OF A MODULAR BUILDING BLOCK PHOTOVOLTAIC CONCENTRATOR ARRAY FIELD
J. A. Sanders, D. C. Cass, and S. Broadbent Jun. 1985 81 p
(Contract DE-AC04-76DP-00789)
(DE85-016032; SAND-84-7022) Avail: NTIS HC A05/MF A01

A building block array field nominally rated at 25 kW has been installed in Albuquerque, New Mexico. The building block is a single source electrical circuit of six center pedestal two-axis tracking arrays connected in parallel and having a nominal operating voltage of 420 volts DC. Each array contains 60 point-focusing Fresnel lens photovoltaic concentrator modules connected in series for a nominal power output of 4.2 kW per array. The structural design uses a center pedestal two-axis cantilevered support tube with a closed loop sun sensor electronic control system. A master control provides manual override of the array field. The installation was accomplished without difficulty and demonstrated the ease of turnkey building block installation. The costs of 1 MW size fields is estimated to be $6.99 per watt installed based on the building block installation. Author

This summary of FY 1985 accomplishments contains the technical highlights of SERI's program in photovoltaic research and development and a bibliography of technical publications. Also included are several management highlights. Selected accomplishments are categorized according to research tasks identified in the DOE National PV Program's Five-Year Research Plan. The DOE task areas appearing here are Single-Junction Thin Films, High-Efficiency Multijunction Concepts, Innovative Concepts, Flat-Plate Collectors, and System Experiments. Subcontract program categories include amorphous thin films, high-efficiency concepts, polycrystalline thin films, crystalline silicon, and innovative concepts, which are further subdivided into new ideas, the University Participation Program, and photoelectrochemical cells. SERI's internal PV task areas are PV Devices and Measurements, Solid State Research, Insolation Resource Assessment, Advanced PV Systems Research, and solar electric research activities. The bibliography is a compilation of the technical publications resulting from all of SERI's research during FY 1984 and FY 1985. The entries are listed alphabetically by author. DOE

PARABOLIC DISH MODULE EXPERIMENT Final Test Report
Mar. 1986 206 p
(Contract DE-AC04-76DP-00789)
(DE86-009819; SAND-85-7007) Avail: NTIS HC A10/MF A01

A development test model of the 8-meter Solar Brayton Parabolic Dish Module has been designed, fabricated, and tested. The test model consists of five major subsystems: Sanders ceramic honeycomb solar receiver; LaJet LEC460 solar concentrator; AiRsearch SABC MKIIIA engine, Abacus 8 kW ac inverter; and a Sanders designed and built system controller. Goals of the tests were to integrate subsystem components into a working module, demonstrate the concept, and generate 5 kWe (hybrid) and 4.7 kWe (solar only) input. All subsystem integration goals were successfully achieved, but system performance efficiency was lower than expected. Contributing causes of the lower performance efficiencies have been identified. Modifications needed to restore performance to the required levels and improve the system life cycle cost have been addressed and are the subject of this final report. DOE

EVALUATION OF HELIOSTAT FIELD-RECEIVER CONFIGURATIONS
S. E. Faas and W. S. Winters Mar. 1986 75 p
(Contract DE-AC04-76DR-00789)
(DE86-009875; SAND-86-8007) Avail: NTIS HC A04/MF A01

This report evaluates and compares north heliostat field/cavity receiver configurations and surround heliostat field/external receiver configurations. The receiver coolants are molten nitrate salts and liquid sodium. Both field/receiver configurations use molten salt thermal storage; the sodium receiver is thermally connected to thermal storage by a sodium-to-salt heat exchanger. The heliostat field size is fixed at 1,000,000 square meters of reflective area, and the delivered molten salt temperature is fixed at 566 C. The delivered thermal power varies from 500 to 600 MW(sub t), depending on the overall system efficiency. The generic north heliostat field/cavity receiver configurations were found to be 6 to 10 percent efficient than a generic surround field/external receiver configuration. There was little or no difference found in the transient performance of a molten salt receiver compared to a sodium receiver connected to a sodium-to-salt heat exchanger. Four configurations were of particular interest: (1) a north heliostat field/single cavity molten salt receiver, (2) a surround heliostat field/external cylinder molten salt receiver, (3) a surround heliostat field/external cylinder liquid sodium receiver, and (4) a north heliostat field/single cavity liquid sodium receiver. It was found that the surround field/liquid sodium external receiver configuration may provide energy at a 14 percent lower levelized energy cost than a north field/molten salt cavity receiver configuration. However, the cost advantage of the surround field/liquid

sodium external receiver is not conclusive because of uncertainties in system component costs. DOE

AEROELASTIC EFFECTS IN THE STRUCTURAL DYNAMIC ANALYSIS OF VERTICAL AXIS WIND TURBINES
D. W. Lobitz and T. D. Ashwill Apr. 1986 23 p
(Contract DE-AC04-76DP-00789)
(DE86-009542; SAND-85-0957) Avail: NTIS HC A02/MF A01

Aeroelastic effects impact the structural dynamic behavior of vertical axis wind turbines (VAWRs) in two major ways. First, the stability phenomena of flutter and divergence are direct results of the aeroelasticity of the structure. Secondly, aerodynamic damping can be important for predicting response levels, particularly near resonance, but also for off-resonance conditions. The inclusion of the aeroelasticity is carried out by modifying the damping and stiffness matrices in the NASTRAN finite element code. Through the use of a specially designed preprocessor, which reads the usual NASTRAN input deck and adds appropriate cards to it, the incorporation of the aeroelastic effects has been made relatively transparent to the user. NASTRAN flutter predictions are validated using field measurements and the effect of aerodynamic damping is demonstrated through an application to the Test Bed VAWT being designed at Sandia. DOE

INORGANIC COMPOUNDS FOR PASSIVE SOLAR ENERGY STORAGE: SOLID-STATE DEHYDRATION MATERIALS AND HIGH SPECIFIC HEAT MATERIALS Progress Report
L. J. Struble and P. W. Brown Apr. 1986 60 p
(Contract DE-AI01-76PR-06010)
(DE86-010214; NBSIR-86-3325) Avail: NTIS HC A04/MF A01

Two classes of hydrated inorganic salts have been studied to assess their potential as materials for passive solar energy storage. The materials are part of the quaternary system CaO-Al2O3-SO3-H2O and related chemical systems, and the two classes are typified by ettringite, a trisubstituted salt, and Friedel's salt, a monosubstituted salt. The trisubstituted salts were studied for their possible application in latent heat storage, utilizing a low-temperature dehydration reaction, and both classes were studies for their application in sensible heat storage. In order to assess their potential for energy storage, the salts have been synthesized, characterized by several analytical techniques, and thermal properties measured. The dehydration data of that the trisubstituted salts vary somewhat with chemical composition, with the temperature of the onset of dehydration ranging from 6(0)C to 33(0)C, and enthalpy changes on dehydration ranging from 60 to 200 cal/g. Heat capacity is less variable with composition; values for the trisubstituted phases are 30 cal/g/(0)C and for the monosubstituted phases between 0.23 and 0.28 cal/g/(0)C. Preliminary experiments indicate that the dehydration is reversible, and suggest that the materials might have additional potential as solar desiccant materials. These thermal data demonstrate the trisubstituted salts have potential as latent heat storage materials, and that both classes of salts have potential as sensible heat storage materials. DOE

PROGRESS IN FUEL CELLS FOR TRANSPORTATION APPLICATIONS
H. S. Murray 1986 20 p Presented at the 3rd International Symposium on Hydrogen Produced from Renewable Energy, Manoa, Hawaii, 22 May 1986
(Contract W-7405-eng-36)
(DE86-010206; LA-UR-86-1476; CONF-8605109-1) Avail: NTIS HC A02/MF A01

The current and projected states of development of fuel cells are described in terms of availability, performance, and cost. The applicability of various fuel cell types to the transportation application is discussed, and projections of power densities, weights, and volumes of fuel cell systems are made into the early 1990s. Research currently being done to advance fuel cells for vehicular application is described. A summary of near-term design parameters for a fuel cell transit line is given, including bus performance requirements, fuel cell power plant configuration, and battery peaking requirements. The objective of this paper is to determine a fuel cell technology suitable for near-term use as a vehicular power plant. The emphasis of the study is on indirect methanol fuel cell systems. DOE

ROTOR AERODYNAMICS OF HORIZONTAL AXIS WIND TURBINES. SUMMARY OF LECTURES AND DISCUSSIONS. PRESENTATION OF RESULTS OF CALCULATION METHODS [ROTORAERODYNAMICA VAN HORIZONTALE-AS WINDTURBINES NEWIN-WORKSHOP D.D. 16-4-1985. SAMENVATTING VAN DE LEZINGEN EN DISCUSSIES. PRESENTATIE VAN RESULTATEN UIT BEREKENINGSMETHODEN]
G. J. W. vanBussel and G. A. M. vanKuik Sep. 1985 39 p In DUTCH Proceedings of NEWIN Workshop, Delft, Netherlands, 4 Apr. 1985
(THD-IW-R505; THE-R-738-D; ESA-86-97706) Avail: NTIS HC A03/MF A01

Models for the calculation of the aerodynamic performances of horizontal-axis wind turbines under uniform straight flow were evaluated. The axial momentum theory was revised. The blade-element momentum method PHATAS and its Viterna-Corrigan correction are presented. The lifting line methods PREDICHAT and HELIX are explained. The results of the calculation methods for a reference rotor configuration were compared with measurements. Large discrepancies between the methods are found. Theory and experiment differ too much to allow a reliable prediction of the performance of designs. The measurements were not good enough for a correct evaluation of the theoretical models. The very large deviations of the results of PHATAS compared to other methods cannot be explained. ESA

OPTICAL POWER FLOW WITH SEQUENTIAL QUADRATIC PROGRAMMING [OPTIMAL POWER FLOW MET SEQUENTIAL QUADRATIC PROGRAMMING]
R. A. M. vanAmerongen 31 Jan. 1985 75 p In DUTCH

(ESA-86-97708) Avail: NTIS HC A04/MF A01

Newton's method as an approach to solve the optimal power flow problem in electric power plants is presented. A general formulation of the optimal flow problem is given. Newton's method is applied to solve the nonlinear Kuhn-Tucker conditions by iteration. Every Newton step is calculated by solving a quadratic programming problem. Variations of the sequential quadratic programming method are presented. Byproducts of the optimization, namely the Lagrange multipliers and their interpretation as marginal costs and shadow prices, are outlined. The most important computer programs are enclosed. ESA

LOW FREQUENCY NOISE AS A CONTROL TEST FOR SPACE SOLAR PANELS

B. Crsal, R. Alabedra, and R. Ruas 1986 25 p

(SNIAS-861-440-109; ESA-86-97617) Avail: NTIS HC A02/MF A01

The use of low frequency noise as a nondestructive test of forward biased solar panels is studied. It is shown that by this method one cell with a given defect can be detected in a solar panel under dark condition. The theoretical analysis indicates that the electrical cell characteristics I-V are unchanged when a small defect is introduced while the noise of the cell with a defect is 10 to 15 times higher than that of a good cell. Experiments with a 5 x 5 panel shows that when a good cell is replaced with another with a defect the overall panel noise response increases by 30%. ESA

BALLOON TRACER FOR ATMOSPHERIC POLLUTANTS

E. W. Lichfield, M. D. Ivey, B. D. Zak, and H. W. Church 1985 11 p Presented at the ARGOS Users Conference, New Orleans, La., 23 Sep. 1985 Prepared in cooperation with Technadyne Engineering Consultants, Albuquerque, N. Mex. and Telemetrics Southwest, Alguquerque, N. Mex.

(Contract DE-AC04-76DP-00789)

(DE86-007144; SAND-86-0221C; CONF-8509254-1) Avail: NTIS HC A02/MF A01

An operational prototype of the Balloon Tracer was developed and described. This prototype was designed to be capable of meeting all of the desired specifications for the Balloon Tracer. Its buoyancy adjustment subsystem is shown. Three Gillian instrument pumps operating in parallel provide a flow of about 12 liters per minute, depending upon backpressure. The miniature Klippard mechanical valves are actuated by a servo mechanism which only requires power when the state of the valves is being changed. The balloon itself for the operational prototype is just under 3 meters in diameter. A block diagram of the operational prototype payload measures ambient pressure, temperature, and humidity obtained from AIR which outputs its data in ASCII format. The vertical anemometerhas a measured starting speed of under 2 cm/s, which has a Gill styrofoam propeller and a Spaulding Instruments rotation sendor. The command decoder is built around a chip developed originaly for remote control television tuners. The command receiver operating on 13.8935 MHz was developed and built by Hock Enginffering. The Argos transmitter is a Tectonic platform transmitter. The heart of the control both random access both and read only memory. DOE

N86-32000# Oak Ridge National Lab., Tenn.

APPLICATION OF A GEOGRAPHIC INFORMATION SYSTEM IN THE STUDY OF ACIDIC DEPOSITION

R. J. Olson 22 Jan. 1986 18 p Presented at the Geographic Information Systems for Environmental Protection, Las Vegas, Nev., 22 Jan. 1986

(Contract DE-AC05-84OR-21400)

(DE86-008220; CONF-860161-1) Avail: NTIS HC A02/MF A01

The Oak Ridge National Laboratory (ORNL) Geographic Information System (GIS) is a primary tool for data base management, analysis, and graphic display in the assessment of acidic deposition affects on aquatic resources in the Adirondack Mountains of New York State. Functions of the ORNL GIS include: (1) data input and digitizing; (2) data transformation and manipulation; (3) data management and extraction; (4) integration and analysis; and (5) output and display. The GIS utilized watershed units, defined by digitizing boundaries drawn on large-scale topographic maps, to serve as common spatial units for integrating over 200 thematic variables for 463 headwater lakes. Many of the thematic variables used in the assessment involved manipulating several spatial data sets with specific algorithms to calculate levels of stress or natural conditions that could affect the aquatic resources. For example, precipitation amount and pollutant ionic concentrations were merged to estimate deposition values for each lake. Central to the GIS work is a data base management and statistical package to use with the thematic data base to develop multiple linear regression models for lake pH and alkalinity with watershed variables. Communication of the results of the assessment with computer-generated maps facilitated the understanding of complex spatial patterns. DOE

INVESTIVATIONS OF DEPTH-RESOLVED LASER REMOTE MEASUREMENT OF NO2 AND SO2 IN THE VISIBLE AND UV SPECTRAL DOMAINS Thesis - Hamburg Univ. [UNTERSUCHUNGEN ZUR ORTSAUFLOESENDEN LASER-FERNMESSUNG VON NO2 UND SO2 IM SICHTBAREN UND ULTRAVIOLETTEN SPEKTRALBEREICH]
W. Staehr 28 Aug. 1985 126 p In GERMAN; ENGLISH summary
(GKSS-85/E/48; ISSN-0344-9629; ESA-86-97407) Avail: NTIS HC A07/MF A01

A lidar system was used for the depth-resolved remote measurement of the gaseous atmospheric polluants NO2 and SO2 by the differential absorption and scattering technique. The system was used to measure atmospheric extinction and backscattering coefficients under varying visibility conditions. The results of a detailed analysis of statistical and systematic errors of the trace gas detection were confirmed by experiment. For NO2 the sentitivity and data range are 10 ppb and 6 km, respectively; for SO2 15 ppb and 3 km. Field tests demonstrate the capabilities of the system to monitor ambient level concentrations as well as to determine quantitatively emissions from individual sources. ESA

(BMFT-FB-W-85-016; ISSN-0170-1339; ESA-86-97460) Avail: NTIS HC A07/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 30.50

The results of rocket-launched experiments in the mesosphere and the thermosphere to measure CO2, O3, H2O and O(3p) infrared emissions using liquid helium cooled spectrometers aboard Skylark 7 during the Energy Budget Campaign 1980/81 are compared to predictions. A computer program was developed to solve the radiation transport equation and is used to determine mesospheric temperature profiles, ozone, and water vapor density. Ozone varies in winter at high altitudes by + or - 30%. Anticorrelation in ozone and water vapor profiles in the mesosphere is noted. The water vapor distribution is inhomogeneous vertically and horizontally. Measurements of atomic oxygen fine structure radiation at 63 microns are compared to model calculations and show a consistent image due to reduced atomic transition or to reduced impact excitation cross sections. ESA

MEASURES OF MEASUREMENT ADEQUACY c64
In its System Study of the Utilization of Space for Carbon Dioxide Research Oct. 1985 14 p (For primary document see N86-32005 23-46)
Avail: NTIS HC A23/MF A01 CSCL 12A

The adequacy of a measurement instrument is often characterized in terms of the precision, accuracy, and confidence that can be assigned to the measurements that it produces. The accuracy of the measurement may be defined as the size of the difference between the true and measured values. The precision of the system over a large number of measurements may be defined in terms of the sample standarad deviation. The confidence in an interval-values measurement may be defined as the probability that this interval contains the true value. These concepts are discussed in terms of their mathematical solutions. A PROCEDURE FOR SPACE SDR PRIORITIZATION c47
In its System Study of the Utilization of Space for Carbon Dioxide Research Oct. 1985 12 p (For primary document see N86-32005 23-46)
Avail: NTIS HC A23/MF A01 CSCL 04B

It was first necessary to arrive at a common set of attributes

which described the relative importance of each Scientific Data Requirement (SDR) to the DOE CO2 Research Program. Many attributes were considered. Some were rejected because they related more to engineering considerations than to scientific ones. Finally four were selected: importance for early detection of CO2-induced effects; need for additional measurements; importance for model inputs; and importance for model outputs. Each SDR was scored on these attributes. These scores were categorical (for example, low, medium, and high) and formed the basis for assigning a relative value to each SDR. For this ranking a methodology based on dominance theory was used. The methodology and the selected SDRs are discussed. Author

THEORY AND OPERATION OF THE GOULD 32/27 PROGRAMS ABLE-2A AND EBLE FOR THE TROPOSPHERIC AIR MOTION MEASUREMENT SYSTEM Final Report, 1 Jan. - 31 Dec. 1985
Carolyn Butler Jun. 1986 102 p
(Contract NCC1-28)
(NASA-CR-176856; NAS 1.26:176856; GSTR-86-3) Avail: NTIS HC A06/MF A01 CSCL 04A

Software development for the Trospheric Air Motion Measurement Systems (TAMMS) is documented. In July/August the TAMMS was flown on the NASA/Goddard Flight Center Electra aircraft for 19 mission for the ABLE-2A (Amazon Boundary Layer Experiment) in Brazil. In December 1985, several flights were performed to assess the contamination and boundary layer of the Electra. Position data, flow angles, pressure transducer measurements were recorded. The programs written for the ABLE-2A were modified due to timing considerations for this particular program. The 3-step programs written for EBLE (Electra Boundary Layer Experiment) are described. Power up and log-on procedures are discussed. A few editing techniques are described for modification of the programs. B.G.

INTRAPLATE DEFORMATION DUE TO CONTINENTAL COLLISIONS: A NUMERICAL STUDY OF DEFORMATION IN A THIN VISCOUS SHEET
Steven C. Cohen and Richard C. Morgan Oct. 1985 27 p
(NASA-TM-86235; Rept-86B0019; NAS 1.15:86235) Avail: NTIS HC A03/MF A01 CSCL 08E

A model of crustal deformation from continental collision that involves the penetration of a rigid punch into a deformable sheet is investigated. A linear viscous flow law is used to compute the magnitude and rate of change of crustal thickness, the velocity of mass points, strain rates and their principal axes, modes of deformation, areal changes, and stress. In general, a free lateral boundary reduces the magnitude of changes in crustal thickening by allowing material to more readily escape the advancing punch. The shearing that occurs diagonally in front of the punch terminates in compression or extension depending on whether the lateral boundary is fixed or free. When the ratio of the diameter of the punch to that of the sheet exceeds one-third, the deformation is insensitive to the choice of lateral boundary conditions. When the punch is rigid with sharply defined edges, deformation is concentrated near the punch corners. With non-rigid punches, shearing results in deformation being concentrated near the center of the punch. Variations with respect to linearity and nonlinearity of flow are discussed. Author

MODEL FOR THE STEADY-STATE ROTATIONAL STIMULATED RAMAN GAIN COEFFICIENTS IN THE ATMOSPHERE
G. C. Herring, William K. Bischel, M. J. Dyer, and D. L. Huestis 21 Apr. 1986 78 p
(Contract N00014-84-C-0256)
(AD-A167469; SRI-MP-85-217; TR-1) Avail: NTIS HC A05/MF A01 CSCL 07/4

A model for stimulated Raman scattering in the atmosphere is described for the pure rotational transitions in N2. An empirical formula for the wavelength dependence of the Molecular Nitrogen polarizability anisotropy is derived from published measurements. The temperature and density dependence of the Raman linewidths were also measured in the laboratory. These results were then used to calculate the steady-state, plane wave Raman gain coefficient over the lower 100 km of the atmosphere. At sea level, the strongest lines have gain coefficients of 0.7 cc/km-MW for a Stokes laser wavelength of 350 nm. GRA

DETERMINATION OF THE ATMOSPHERIC AEROSOL DISTRIBUTION BY MULTI-CHANNEL REMOTE SENSING TECHNIQUES M.S. Thesis
Scott R. Bulfinch Mar. 1986 88 p
(AD-A167885) Avail: NTIS HC A05/MF A01 CSCL 04/1

A simple image processing technique applied to channel 1 and channel 2 of the NOAA AVHRR sensor may be used to discern variations in aerosol particle size distribution. Ratios of the channel 1 albedo to the channel 2 albedo are calculated and displayed as an image. High ratio values are shown to indicate increased levels of submicron aerosols, while low ratio values indicate increased levels of supermicron aerosols. Horizontal variations in aerosol distributions may be observed directly by noting variations in ratio values, and vertical distributions may be inferred through the application of appropriate regional models of aerosol transport. A model of offshore advection of urban particles within the marine boundary layer is presented. Interpreting ratio values in light of this model, the offshore transport of urban aerosol particles is observed in AVHRR imagery of Southern California during the period 17-25 October 1984. (AD-A168115; DNA-TR-85-85) Avail: NTIS HC A10/MF A01 CSCL 20/14

This report describes recent observations of high latitude ionospheric structure and dynamics from the HILAT satellite and the Sondrestrom and EISCAT incoherent scatter radars. Plasma turbulence theory and ionospheric plasma diffusion processes are also described. Measured variations in latitude and local time of total electron content, levels of radio wave scintillation, and magnetospheric electrodynamics are presented for the northern polar regions. Seasonal and solar cycle variations of these phenomena are examined. Magnetic flux tube interchange produced by magnetospheric electrostatic turbulence (rather than local instability polarization fields) is suggested as an important source of high latitude ionospheric structure. The large scale magnetospheric potential field is also shown to be capable of steepening and structuring plasma gradients. These processes would certainly structure late time nuclear produced plasma. BALANCE OF THE TROPOSPHERIC OZONE AND ITS RELATION TO STRATOSPHERIC INTRUSIONS INDICATED BY

COSMOGENIC RADIONUCLIDES, PART 13 Annual Report, 1 Feb. 1982 - 31 Jan. 1983
R. Reiter, H. J. Kanter, H. Jaeger, and K. Munzert Jun. 1985 118 p
(Contract DE-AC02-76EV-03425)
(DE85-015560; DOE/EV-03425/27-Pt-13) Avail: NTIS HC A06/MF A01

The results of the statistical evaluation of the recording series of the tropospheric ozone concentrations in the air obtained at 3 different levels are presented. Data from the period 1977 to 1984 have been examined for this purpose. The mean annual variation of the ozone concentration and interannual variations are discussed. Using the annual means, it is attempted to make a trend analysis. To clarify the climatology of the stratospheric exchange, the measuring series of cosmogenic radionuclide Be-7, P-32, P-33 covering the period 1970 through 1981 are statistically analyzed with regard to the ozone concentration recorded on the Zugspitze. The statistics of stratospheric intrusions are shown and the stratospheric residence time is estimated. Effects of the eruption of volcano El Chichon in April 1982 on the concentration of the stratospheric aerosol are documented. The time variation of the concentration of the stratospheric aerosol is studied with consideration of the stratospheric circulation. The noted effects are weighted by a comparison with earlier volcanic eruptions. Author

E-LAYER IONOSPHERIC DISTURBANCES FOLLOWING THE COALINGA EARTHQUAKE
T. J. Fitzgerald and J. H. Wolcott Nov. 1985 39 p
(Contract W-7405-eng-36)
(DE86-008588; LA-10607-MS) Avail: NTIS HC A03/MF A01

A bistatic HF Doppler network in California recorded ionospheric disturbances after the Coalinga, California, earthquake of May 2, 1983. The ionospheric disturbances appear to be associated with acoustic waves launched vertically into the atmosphere from the ground motion caused by radially propagating surface seismic (Rayleigh) waves. The ionospheric disturbances were detected by variations in the frequency of the received transmissions (Doppler shifts); such disturbances have been observed in association with a number of previous earthquakes. The Doppler shifts were caused by phase path changes induced by the motion of the neutral atmosphere at the reflection height of the radio wave (200 km). We have also detected changes in the spectrum of the received transmissions following the Coalinga earthquake at the time of the passage of the acoustic waves through the E-layer. We interpret these spectral changes as an indication of specular reflection of the radio waves from index of refraction gradients induced by the acoustic waves, which have undergone significant nonlinear steepening during their propagation to 100 km. Since the acoustic waves were propagating upwards, the reflections had negative Doppler shifts. DOE

HOSTILE ENERGETIC PARTICLE RADIATION ENVIRONMENTS IN EARTH'S OUTER MAGNETOSPHERE
D. N. Baker, R. D. Belian, P. R. Higbie, R. W. Klebesadel, and J. B. Blake 1986 15 p Presented at the AGARD Symposium, Hague, Netherlands, 2 Jun. 1986 Prepared in cooperation with Aerospace Corp., El Segundo, Calif.
(Contract W-7405-eng-36)
(DE86-005752; LA-UR-86-1011; CONF-8606108-1) Avail: NTIS HC A02/MF A01

Many spacecraft operational problems in Earth's outer magnetosphere appear to be due to intense, transient radiation phenomena. Three types of naturally-occurring, and highly variable, hostile particle radiation environments are encountered at, or near, the geostationary orbit: (1) high-energy protons due to solar flares; (2) energetic ions and electrons produced by magnetospheric substorms; and (3) very high energy electrons of uncertain origin. Present particle sensor systems provide energetic particle detection and assessment capabilities during these kinds of high-energy radiation events. In this paper, particular emphasis is given to highly relativistic electrons (3 approx. 10 MeV). Electron fluxes and energy spectra are shown which were measured by two high-energy electron sensor systems at 6.6 R sub E from 1979 through 1984. Large, persistent increases in this population were found to be relatively infrequent and sporadic in 1979-81 around solar maximum. During the approach to solar minimum (1981 to present) it is observed that the highly relativistic electrons occur with a regular 27-day periodicity, and are well associated with the re-established solar wind stream structures. The present analysis suggests that the Jovian magnetosphere is a recurrent source of this significant electron population in the outer terrestrial magnetosphere and that these electrons have a very deleterious influence on spacecraft systems due to deep dielectric charging and low-dose susceptibility effects. DOE

ESTIMATES OF AVAILABLE SOLAR RADIATION AND PHOTOVOLTAIC ENERGY PRODUCTION FOR VARIOUS TILTED AND TRACKING SURFACES THROUGHOUT THE US BASED ON PVFORM, A COMPUTERIZED PERFORMANCE MODEL
D. F. Menicucci and J. P. Fernandez Mar. 1986 97 p Prepared in cooperation with New Mexico Univ., Albuquerque
(Contract DE-AC04-76DP-00789)
(DE86-009549; SAND-85-2775) Avail: NTIS HC A05/MF A01

An improved photovoltaic performance model called PVFORM has been developed at Sandia National Laboratories. This new model incorporates the latest improvements in solar modelling techniques including the Perez anisotropic solar diffuse model. The PVFORM model has been used to produce tables of average solar radiation availabilities and corresponding direct current energy performance for a photovoltaic module mounted in various tilted and tracking configurations. Solar availabilities are also computed for some vertical and 45 deg. tilted wall surfaces for use in passive solar design. The tables contain average daily solar availabilities and PV energy production for 38 sites throughout the US. Each table contains four average daily values representing the four seasons of the year along with an annual average. Typical weather conditions are also presented for each of the 38 sites. This new model and the set of tables presented in this report are of special importance to solar energy system designers because they provide more accurate estimates of insolation availability on fixed and tracking surfaces by as much as 20%, PVFORM has been shown to be accurate to within 5% to 7% with no observable prediction bias. Use of the PVFORM model or the tabulated data found in this report will enable the architect or engineer to design more cost effective solar energy systems. DOE

PACIFIC NORTHWEST SOLAR RADIATION DATA
1 Apr. 1986 264 p
(Contract DE-AC79-81BP-24574)
(DE86-009635; DOE/BP-24574/2) Avail: NTIS HC A12/MF A01

The University of Oregon (UO) Solar Monitoring Laboratory has been making solar radiation measurements since 1975. Principal support for this work comes from the Bonneville Power Administration (BPA), along with the Eugene Water and Electric Board (EWEB) for the Eugene station, Washington Water Power (through a subcontract from the University of Idaho) for the Coeur d'Alene site and Pacific Power and Light (PP and L) for the Hood River site. This booklet is the final solar radiation report published under the auspices of BPA and contains all data gathered through December 31, 1985. Discussion of the data handling procedures and the accuracy of the data are included in the overview of the solar radiation network at the beginning of this booklet. A summary of the data follows in the form of monthly averaged and long term hourly averaged tables for each site. A comprehensive listing of the daily data is given at the end of the book. Hourly data for all direct monitoring sites are available from BPA except for Eugene, Coeur d'Alene, and Hood River. The hourly Eugene data are available from the University of Idaho. Fifteen minute Hood River data are available from PP and L. DOE

SATELLITE-EARTH RANGE MEASUREMENTS. PART 1: CORRECTION OF THE EXCESS PATH LENGTH DUE TO ATMOSPHERIC WATER VAPOR BY GROUND BASED MICROWAVE RADIOMETRY
Gunnar Elgered, Bernt Roennaeng, Erik Winberg, and Jan Askne Paris ESA Apr. 1985 115 p
(Contract ESTEC-5910/84-NL-MD)
(CTH-RR-147-Pt-1; ESA-CR(P)-2176-Pt-1; ESA-86-97221) Avail: NTIS HC A06/MF A01

The excess delay of radio waves penetrating the neutral atmosphere of the Earth, especially the delay due to water vapor, is discussed. The state of the art of sounding techniques and instrumentation, in particular microwave radiometry is reviewed. The physical background of the water vapor radiometer (WVR) method is presented and seven types of WVR are described. The expected accuracies of wet path delays vary with the local climate as well as with instrumental errors and the operating frequencies of the WVR. It is shown that errors in the wet path delay for zenith observations range from 0.4 to 0.9 cm rms for optimum WVR frequencies and instrumental errors of 0.5 K rms. Two WVR designs, one with high accuracy and one with low cost (but less accurate) are proposed for the ESA POPSAT system. ESA

MIXING LENGTH AND TURBULENT DIFFUSION COEFFICIENT IN ATMOSPHERIC SIMULATION MODELS [MISCHUNGSWEG UND TURBULENTER DIFFUSIONSKOEFFIZIENT IN ATMOSPHAERISCHEN SIMULATIONSMODELLEN]
Heinrich Wilhelm Detering 1985 119 p In GERMAN
(Rept-25; ISBN-3-923624-03-4; ISSN-0440-2820; ESA-86-97478) Avail: NTIS HC A06/MF A01

The significance of parameterization of turbulent flows in comparison with other model suppositions, as well as the effects of several parameterization methods on the results of numerical models were investigated. For measured and hypothetical flows, the differences in the results obtained with different mixing length suppositions in a one and two-dimensional numerical model with a first kind equation closure are shown. The effect of parameterization of turbulent flows on the interpretation of numerically simulated mesoscale phenomena is discussed. It is shown that the closure which is presently mainly used for strong shear flow, provides realistic results for atmospheric flows (even under diabatic conditions) by a modification of the prognostic energy dissipation equation. For stable lamination a functional dependence of the ratio of heat and momentum diffusion coefficient on the Richardson number which improves the model results is given. It is explained which complex equation structure is required to obtain an approximate value of the turbulent diffusion coefficients. ESA

RADIATION IN BOUNDARY LAYER CLOUDS
Y. Fouquart *In* World Climate Programme Report of the JSC/CAS Workshop on Modeling of Cloud Topped Boundary Layer 1985 40 p Sponsored by Programme National d'Etudes de la Dynamique du Climat (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

The impact of radiation on boundary layer clouds and its influence on planetary radiation budget are discussed. The studies of the localization of the radiative divergence and its influence upon the entrainment rate are reviewed. The parametrization of the optical properties of boundary layer clouds, the short wave spectral range and the long wave optical properties are also examined. Results of field experiments are used to validate short wave parameterizations, and stratocumulus reflectivity observations are employed to validate satellite data. It is shown that the infrared optical properties of the boundary layer clouds can be adequately modeled in terms of an infrared window emissivity, the influence of scattering being weak. It is recommended that models of the boundary layer include a representation of the radiative processes allowing for horizontal inhomogeneities. ESA

PHYSICAL PROPERTIES OF STRATIFORM CLOUDS AND THEIR PARAMETRIZATION
O. A. Avaste *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer (WCP-106) 1985 17 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

The properties of stratiform clouds are studied in order to analyze the type and number of parameters needed for calculation of radiative fluxes and flux divergences with adequate accuracy. It is shown that the accuracy of calculations depends greatly on the accuracy of the integral transmittance function, which changes considerably when vapor concentration in the atmosphere is large. It is suggested that satellite measurements reveal climatic signals after statistical data processing even if the accuracy of a single temperature measurement is 1.5 to 2 C. ESA

MODELING AND OBSERVATIONS OF THE STRATOCUMULUS-TOPPED ATMOSPHERIC BOUNDARY LAYER
A. G. M. Driedonks *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 24 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

Simulations of the dry atmospheric boundary layer with a positive surface heat flux are discussed. They show that its structure is governed by a simple scaling law, while the cloud topped boundary layer depends on a multitude of parameters. It is shown that the turbulent structure of the cloudy layer differs drastically from one case to another. In mixed layer models the basic problem is the formulation of the entrainment rate at the top. The problems found in multilevel models with higher order turbulence closure schemes are also discussed. ESA

N86-32034# National Center for Atmospheric Research, Boulder, Colo.
THE STRUCTURE OF A STRATUS-TOPPED PLANETARY BOUNDARY LAYER AS SEEN THROUGH A LARGE-EDDY SIMULATION
Chin-Hoh Moeng and John C. Wyngaard *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 11 p Sponsored by NSF (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

A planetary boundary layer model which includes turbulence, long wave radiation, and condensation processes is described. The statistics derived from the model-generated data indicate that the contribution of the resolvable scale eddies to the turbulence energy and vertical fluxes of buoyancy and moisture is much larger than that of the subgrid eddies. The analysis of this data set shows implications concerning boundary layer models. It is shown that the ratio of turbulence energy production and consumption rates is 0.04 for Eulerian partitioning and 0.27 for Lagrangian partitioning on mixed layer models. In the case of second order closure models the buoyancy contribution to the pressure gradient temperature covariance is one half of the direct buoyancy production term in the vertical flux equation. KEY PROBLEMS OF PARAMETERIZATION FOR SIMPLE CLOUD-TOPPED BOUNDARY LAYER MODELS
David A. Randall *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 17 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

Fractional cloudiness, mesoscale cellular convection, and detached cloud layers and diurnal cycle are discussed. A parameterization for any of the three would find immediate application in atmospheric models. ESA

N86-32036# Meteorological Office, Bracknell (England). Cloud Physics Branch.
NOTES ON MODELING THE CLOUD TOPPED BOUNDARY LAYER
S. Nicholls *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 11 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

Aspects of boundary layer models concerning unbroken, nonfreezing stratiform cloud layers are discussed. Evidence from observation data is reviewed. The current state of models is examined. A mixed layer model is described, and the results of a 24 hr integration with this model are given. It is shown that more data are needed to assess when and where model concepts are valid and, if necessary, how new models can be formulated. ESA

N86-32037# National Center for Atmospheric Research, Boulder, Colo.
BOUNDARY LAYER AND CLOUD PARAMETERIZATION IN THE NCAR COMMUNITY CLIMATE MODEL
R. E. Dickinson *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 3 p Sponsored by NSF (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

Modifications of the Community Climate Model are made and a set of parameters chosen in order to describe cloud-topped boundary layer phenomena. A layer structure treatment is adopted. It is suggested that a useful focus to validate models is the fluxes of heat, moisture, momentum and radiation from and to the surface and their redistribution within atmospheric layers. ESA

N86-32038# European Centre for Medium-Range Weather Forecasts, Reading (England).
PARAMETERIZATION OF THE CLOUD-TOPPED BOUNDARY LAYER IN A GLOBAL FORECAST MODEL
G. Sommeria, J. Slingo, and M. Tiedtke *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 20 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

The formulation of turbulent transports associated with shallow convection, the effect of its introduction in a global circulation model, and the impact of the associated cloud cover are discussed. Different cloud types resulting from the presented equations are almost mutually exclusive and may be combined without difficulty. The cloud distributions produced by the scheme compare well with Meteosat images. ESA

N86-32039# Meteorological Office, Bracknell (England).
SIMULATION OF CLOUDINESS WITH THE UK METEOROLOGICAL OFFICE 11-LAYER AGCM
A. Slingo and R. C. Wilderspin *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 13 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

The ability of AGCM type models to represent the global distribution of cloudiness is assessed. Errors in the low cloud field over the subtropical oceans are of particular concern as the model is being coupled to an ocean model for long-range climate sensitivity experiments. The reason for errors and proposed changes to the model are discussed. Results from an integration with model predicted cloudiness are presented. In spite of the errors discussed, the results are encouraging. ESA

THE SENSITIVITY OF ONE MONTH GCM FORECASTS AT GFDL TO ZONALLY SYMMETRIC CLOUDS, QUASI-REALISTIC SPECIFIED CLOUDS, AND MODEL-PREDICTED CLOUDS
C. T. Gordon *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 21 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

A scheme to generate radiatively constrained low and high cloud fields of specified sigma levels is described. The procedure is carried out at each model grid point. It entails representing the local grid point values of observed short wave and long wave radiation as Taylor series of model diagnosed radiative flux with respect to low and high effective cloud amount, plus a residual. Analyses of Nimbus 7 narrow field of view Earth radiation budget broad band radiative fluxes were used. It is shown that quasi-realistic cloud radiation forcing appears to have a favorable impact on the 5 day mean predicted atmospheric circulation. The results underscore the importance of developing improved cloud prediction schemes and subgrid scale parametrizations of turbulent transport in the planetary boundary layer in the presence of clouds. ESA

BOUNDARY LAYER CLOUDS IN THE ISCCP DATA SETS
Ehrhard Raschke *In* World Climate Programme Report of the JSC/CAS Worskshop on Modeling of Cloud Topped Boundary Layer 1985 23 p (For primary document see N86-32025 23-47)
Avail: NTIS MF A01; HC at WMO, Geneva, Switzerland

The possibilities to map boundary layer clouds with operational satellite imagery are reviewed. The data consist of images of the Earth within spectral regions of reflected solar and emitted thermal radiation, limited to atmospheric windows. The data are additionally degraded in their spatial resolution to pixels of 10 to 15 km in size and sampled at distances from 30 to 50 km. It is concluded that from the ISCCP reduced radiance data sets, the boundary layer clouds can be mapped with restrictions which are discussed. ESA

ON THE EVOLUTION OF PRECIPITATION ASSOCIATED WITH A WINTERTIME EAST COAST CYCLONE: A GALE PRELIMINARY STUDY M.S. Thesis
Robert D. Bievins 1985 112 p
(AD-A166375; AFIT/CI/NR-86-17T) Avail: NTIS HC A06/MF A01

This thesis analyzes and explains the precipitation structure of the 10-12 February 1983 east cost cyclone, which is typical of the type the GALE 1986 field project hopes to study. Careful hourly analysis of surface weather and precipitation were conducted using all available data obtained from the National Climatic Data Center at Asheville, N.C. Surface kinematic calculations were accomplished and compared to the observed precipitation pattern. Vorticity and divergence patterns were found to correlate well with the cold-air damming and the coastal front associated with the cyclone studied, but failed to correlate well with the observed precipitation structure. Adiabatic and kinematic vertical motion profiles were better correlated with the observed precipition, but failed to adequately explain the observed movement of precipitation. Subsequent insentropic analysis, similiar to that of the British researchers, allowed for the three dimensional analysis of air flow. Cross sections were analyzed for potential temperature, mixing ratio, and wind. These analyses revealed a warm conveyor belt and cold conveyor belt similiar to the Carlson (1980) model for midwest cylcones. GRA

SECULAR CLIMATIC PATTERNS OF THE NORTH CENTRAL GREAT PLAINS AND THE CONTINENTAL US M.S. Thesis
Karen Jean Praner 1985 173 p
(AD-A166743; AFIT/CI/NR-86-51T) Avail: NTIS
HC A08/MF A01 CSCL 04/2

Monthly mean maximum temperatures and total precipitation data (1900-1970) were compiled for 144 carefully selected stations in the continental U.S. The north central great plains (NCGP) was divided into regions of similar temperature and precipitation patterns using 39 stations representative of the NCGP. In a like manner, the 144 U.S. stations were grouped into regions with similar patterns of mean annual temperature and total annual precipitation; weighted mean annual temperature and total precipitation series were derived by area-weighting the regional series. Comparison of regional and mean series revealed marked differences between series. Tests of normality and homogeneity of means were conducted for the mean annual temperature and total annual precipitation series; it was determined that several distinctly different periods of temperature and precipitation existed between 1910 and 1970 for both series. The presence of consecutive periods of dissimilar climatic patterns within the 70-year series of climatic elements implies that climate exhibits jump discontinuities which must be explored.

CONTINENTALITY: ITS ESTIMATION AND PHYSICAL SIGNIFICANCE M.S. Thesis
Juan M. YeeFong Dec. 1985 73 p
(AD-A167111; AFIT/CI/NR-86-61T) Avail: NTIS
HC A04/MF A01 CSCL 04/2

An attempt has been made to quantify continentality better than exists in current indexes. Conventional indexes of continentality were examined and their deficiencies noted. Several different approaches were taken to develop alternative continentality indexes. These approaches were: dividing annual temperature range by the difference between summer and winter isolation, regressing annual temperature range on latitude and isolating the residuals such that positive ones represent continental locations and negative ones indicate maritime, or less continental, locations; and finding the summer and winter lag of temperature behind radiation with the cubic spline interpolation technique. All three approaches were used to examine the North American continent as a whole. In addition, the Rocky Mountain and Great Lakes-Appalachia regions were chosen for mesoscale analysis in order to determine what effect elevation and large water bodies have on lag. Isopleth analyses of the plotted values of the proposed alternative indexes were compared with conventional index patterns for North America and with each other. Each newly developed index was evaluated as an appropriate measure of continentality and a physical (meteorological) explanation attempted for the patterns.

A LINEAR STABILITY ANALYSIS OF THE RAPID DEVELOPMENT OF AN EXTRATROPICAL CYCLONE M.S. Thesis

Raymond F. Toll, Jr. Mar. 1986 112 p

(AD-A167808) Avail: NTIS HC A06/MF A01 CSCL 04/2

The phenomenon of the rapid growth and development of an extratropical cyclone over the east coast of the United States (the Carolinas storm of March 1984) is studied through a linear stability analysis. Analyses of the cyclone structure suggest barotropic and baroclinic instabilities may be important. A linear stability model is used to investigate the roles and relative importance of shortwave baroclinic instability and barotropic instability in the growth and development of the storm. The growth rates, phase speeds and structure obtained from the linear model are consistent with those derived from observations. Energy budget results indicate that the vertical and horizontal barotropic terms are at least as important as the baroclinic term. It appears that the early growth and development of the cyclone can be explained through the contributions of barotropic and baroclinic instabilities without including convection. GRA

N86-32058# Naval Postgraduate School, Monterey, Calif.
EFFECTS OF STORM-RELATED PARAMETERS ON THE ACCURACY OF THE NESTED TROPICAL CYCLONE MODEL M.S. Thesis
Brian J. Williams Mar. 1986 108 p
(AD-A167809) Avail: NTIS HC A06/MF A01 CSCL 04/2

The performance of the Nested Tropical Cyclone Model (NTCM) for 542 track forecasts in the western North Pacific is evaluated with respect to five storm-related parameters: intensity, 12-h change in intensity, latitude, longitude and size. This study is intended to aid the operational forecaster in deciding when to use the NTCM-based storm-related parameters at the forecast time. The storm-related parameters are divided into three subsamples (about 180 in each) and the forecasts are evaluated in terms of the mean forecast error, median forecast error and systematic (zonal and meridional) error. Cross-track (CT) and along-track (AT) components are computed relative to a Climatory and Persistence (CLIPER) track. A scoring system (M) that assesses penalty points for forecasts in incorrect terciles is used to compare the accuracy of the NTCM and CLIPER forecasts within the subsamples. For the entire sample, the NTCM has a slow bias, especially at the 12- through 36-h forecast periods. It also performs better for storms with initial latitudes south of 13 N and initial longitudes west of 129E. For very large storms, the NTCM forecasts have both left-of-track and westward biases which indicate problems of the NTCM in predicting recurvature of such systems. The NTCM (which has a 60-kt bogus) forecasts for storms with initial intensities between 50 and 75 kt have much lower CT/AT M scores and smaller forecast errors than the subsamples with initial intensities less than 50 kt. GRA

A DIAGNOSTIC INVESTIGATION OF EXPLOSIVE MARITIME CYCLOGENESIS DURING FGGE M.S. Thesis
Darrell H. Smith Mar. 1986 55 p
(AD-A167810) Avail: NTIS HC A04/MF A01 CSCL 04/2

A collection of explosive and non-explosive storm groups is selected from the western North Atlantic Ocean and western North Pacific Ocean. Explosive cyclogenesis is defined as having a mean sea level pressure fall of 1 mb h for 24 h. Using ECMWF (European Center for Medium Range Forecasts) analyses with FGGE SOP-1 data, the storm environment properties of both storm types are analyzed and compared. Storm environment properties include static stability, layer averaged potential temperature, low level vorticity, vorticity advection, mean and eddy modes of vorticity transport, divergence and kinematic vertical velocities. These properties are compared between the cyclone types at 0 h, 12 h and 24 h periods as well as the overall 24 h average. The largest differences between the explosive group and the non-explosive group are found in the upper level divergence and vorticity advection. The explosive systems are warmer; however, static stabilities of the two groups are quite similar. GRA

GUIDE TO STANDARD WEATHER SUMMARIES AND CLIMATIC SERVICES
Apr. 1986 188 p
(AD-A168099; NAVAIR-50-1C-534) Avail: NTIS HC A09/MF A01 CSCL 04/2

Part 1 of this publication provides a description of published and unpublished climatological summaries. A list of major climatic publications produced by NOCD Asheville (with instructions for obtaining copies) has been included following the Introduction. Part II of this publication is a catalogue of published and unpublished climatological summaries in continent-country-station order. There are twenty-three columns headed by a particular climatic summary or group of summaries. The availability of a climatic summary for a specific station is indicated by a number (the number of years of data used for that summary) under the summary heading. The availability of a World-wide Airfield Summary is indicated by an alphabetic character. GRA

VALIDATION OF GENERAL CIRCULATION MODEL (GCM) CONTROL RUNS
B. D. Santer and T. M. L. Wigley Jan. 1986 136 p
(Contract W-7405-eng-48)
(DE86-009697; UCRL-15789) Avail: NTIS HC A07/MF A01

The simulation performance of three General Circulation Models (GCMs) is examined in a North American/European study area (20°N-85°N; 180°W-60°E). Mean sea level (m.s.l.) pressure fields simulated by the OSU two-layer AGCM (fixed SST experiment), the GISS nine-layer AGCM, and the synchronously-coupled OSU CGCM are compared with observed data, and the significance of differences between observed and simulated m.s.l. pressure distributions is assessed using simple grid-point t-tests and spatial field correlations. Objective indices have been developed which are physically relatable to the properties of quasi-stationary surface ridges and trough. These indices have been used to test whether the models are capable of reproducing important features of the observed seasonal cycles of Iceland Low and Azores High intensity and position. Such objective diagnostic tests enable quantitative analysis of inter-model differences in center of action intensity and location, and are also useful in evaluating the effects of changes in grid resolution, ocean representation, or parameterizations on stationary wave properties at the surface. It is demonstrated that detailed regional examination of model performance is justifiable, even given the spatial resolution of currently operational models, and may provide important diagnostic information for modeling groups. DOE

MEASUREMENT OF THE WIND FIELD. SIMULTANEOUS WIND VELOCITY MEASUREMENTS AT DIFFERENT ALTITUDES WITH HIGH TIME RESOLUTION FOR THE SPECIFICATION OF WIND ENERGY CONVERTERS Final Report, Mar. 1983
Gustav Obermair, Klaus Berberich, Rainer Obermair, and Lorenz Jarass Bonn, West Germany BMFT Dec. 1985 154 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-T-85-141; ISSN-0340-7608; ESA-86-97437) Avail: NTIS HC A08/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 32

Two cylindrical high radio towers, 1.50 m in diameter, were used to study the dynamic behavior of wind energy converters and the central and adjusting systems with a time resolution of 1 sec at different altitudes at a coastal station and at an inland station. Models and criteria were developed to produce statistical data on the spacetime structure of the horizontal wind field and to evaluate one-point measurements corresponding to wind velocity, direction, acceleration and direction changes; and multiple-point measurements of gust factors, autocorrelations, velocity and direction gradients, and statistical distributions. The results are used to describe the simulation of a real wind power plant. ESA

LOCAL JARGON IN WEATHER PEPORTS [LOKALE DEIXIE IN WETTERBERICHTEN]
Artrid Jasse May 1984 8 p In GERMAN Submitted for publication Sponsored by Bundesministerium fuer Forschung und Technologie
(KIT-18; ESA-86-97429) Avail: NTIS HC A02/MF A01

Local jargon used in weather reports was studied because of its requirements for the imaginative faculty and hence faculty of text understanding. It is known that local jargon is not solely a case for linguists. It has also to be treated with a view to the structure of knowledge which serves as its basis. Further knowledge of the processes of spatial imaginative faculty can substantially contribute to the description of local jargon. ESA

ERROR CONTROL OF METEOROLOGICAL MEASUREMENTS [FOUTENCONTROLE BIJ METEOROLOGISCHE METINGEN]
J. J. M. vanGorp and H. M. vanderKolk 1985 73 p In DUTCH
(KNMI-TR-76; B8661060; ISSN-0169-1708; ESA-86-97728) Avail: NTIS HC A04/MF A01

A method of automatic control of measurements was developed for the automation of measurements of meteorological parameters. The detection of defects and disturbances by pattern recognition is discussed. It is explained which characteristics of the measuring signal are used to detect situations differing from the expected normal situation. The spectrum is analyzed in order to find these characteristics. This spectrum can be estimated by using the calculation of the discrete spectrum via fast Fourier transformation. ESA

OBSERVATIONS OF SURFACE WATER TEMPERATURE IN THE NETHERLANDS FROM 1860: THE TEMPERATURE REGIME AND THE CHANGES IN IT
P. C. T. vanderHoeven 1985 114 p In DUTCH; ENGLISH summary
(KNMI-WR-85-6; B8662754; ISSN-0169-1651; ESA-86-97731) Avail: NTIS HC A06/MF A01

The results of different analyses of water temperature observations in the Netherlands covering 2500 station-years are presented. The winter water temperature was observed by IR satellite photos. The history of the station network is depicted. The water movements which are essential to understand the regime of water temperatures are discussed. The relation between all available 10 yr water temperature averages is described. Peculiarities of the annual water temperature are shown by Lissajous figures. Annual averages were analyzed by comparing their deviations with respect to the standard. ESA

A BISPECTRAL METHOD FOR THE HEIGHT DETERMINATION OF ICE CLOUDS
Werner Pollinger and Peter Wendling Dec. 1985 52 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-03; ISSN-0171-1342; ESA-86-97586) Avail: NTIS HC A04/MF A01; DFVLR, Cologn, West Germany DM 36.50

A bispectral method for the height determination of optically thin ice clouds from satellite measurements at two adjacent points of an ice cloud layer was developed. Using 2 wavelengths in the spectral range of the water vapor band at 6.3 microns and in the window range at 11 microns, a transcendental equation was derived under the assumption that both points of the cloud have the same temperature but different optical thickness. The solution of the transcendental equation yields the cloud temperature, and the height via the temperature profile which must be known. The effect of the water vapor above the cloud is corrected for using a radiation transfer model.

ACOUSTIC DESCRIPTION OF SOUTH ATLANTIC OCEAN WARM CORE EDDY
Linda S. Petitpas and David G. Browning 10 Mar. 1986 17 p
(AD-A166323; NUSC-TD-7615) Avail: NTIS HC A02/MF A01 CSCL 20/1

This document contains the viewgraph presentation which investigates the thermohaline/baroclinic scales of the meso-scale eddies associated within the Brazil Malvinas (Falkland) Confluence. One of the eddies investigated was a warm core anti-cyclonic eddy centered about 43 deg 50 min S and 54 deg 15 min W (18-19 October) with a diameter of 125 km. The XBT's and CTD's taken through the eddy were used with a range dependent acoustic prediction ray model (GRASS) to model a cross section of the eddy at 50 Hz comparing propagation loss with source depths of 25, 150, and 500 m and receiver depths of 25, 150, and 500 m. Comparisons were done propagating through the eddy, from the outer edge to the eddy interior, and from the interior to the outer edge. The results were compared with a no eddy, range independent situation. Results showed that due to the presence of a surface duct in the warm core eddy the greatest impact was found propagating a shallow source with a shallow receiver. No effects were seen below 300 m, similar to the North Pacific and Greenland Sea eddies.

GEOTECHNICAL DATA INVENTORY, SOUTHERN CALIFORNIA COASTAL ZONE, CAPE SAN MARTIN (MONTEREY COUNTY) TO MEXICAN BORDER
Dec. 1985 191 p
(AD-A167734; CCSTWS-85-5) Avail: NTIS HC A09/MF A01 CSCL 08/6

The data inventoried in this report covers geotechnical subjects such as the physical properties of the sediment, the presence of landslides in the drainage basin, the productivity of the drainage basin, as well as data on the rate of cliff erosion. Information on geological processes such as the loss of sand to sinks such as submarine canyons, or beach sand-dune build up is also given. The data on the physical properties of the sediments includes texture and petrographic information on samples that were collected from submarine canyons, the continental shelf, the littoral zone, lagoons and dunes, as well as cliffs and drainges. The data is presented both as tabular information and as map indexes. The map indexes show the aerial coverage of the reports from which the data was abstracted.

The purpose of report is to present the results of bathymetric surveys of the nearshore region to a depth of 6 meters relative to mean lower low water (MLLW) at approximately one hundred (100) selected profile stations between Dana Point and the United States/Mexican border. Sediment sampling and measurement of offshore survey stakes/reference rods at specified ranges and depths were also conducted to complement these nearshore bathymetric surveys. The first nearshore bathymetric survey report (CCSTWS, 84-2, April 1984) discussed in detail the surveying techniques and methodologies used to accomplish the goals of this study and provided nearshore profile, sediment sample and reference rod data for Survey 1 (October 1983 to January 1984). This report will supplement and supersede Survey Report no. 1 by providing an updated discussion on profiler system modifications, correcting euoneous survey and sediment sample data entries for Survey No. 1 and provide all additional survey and sediment sample data for Survey 2 (February 1984 to July 1984) and Survey 3 (October 1984 to February 19 85). It is recommended that Survey 1 Data not be used as the baseline survey until a larger survey data base is obtained for comparative analysis.

This is the seventh issue of NASA's USSR Space Life Sciences Digest. It contains abstracts of 29 papers recently published in Russian language periodicals and bound collections and of 8 new Soviet monographs. Selected abstracts are illustrated with figures and tables from the original. Additional features include two interviews with the Soviet Union's cosmonaut physicians and others knowledgable of the Soviet space program. The topics discussed at a Soviet conference on problems in space psychology are summarized. Information about English translations of Soviet materials available to readers is provided. The topics covered in this issue have been identified as relevant to 29 areas of aerospace medicine and space biology. These areas are adaptation, biospherics, body fluids, botany, cardiovascular and respiratory systems, developmental biology, endocrinology, enzymology, exobiology, genetics, habitability and environment effects, hematology, human performance, immunology, life support systems, mathematical modeling, metabolism, microbiology, morphology and cytology, musculoskeletal system, neurophysiology, nutrition, perception, personnel selection, psychology, radiobiology, and space medicine. A CHINCHILLA RESTRAINT SYSTEM
C. E. Hargett, Jr., James H. Patterson, Jr., Dennis L. Curd, Melvin Carrier, Jr., and Ilia M. L. Gautier Jan. 1986 25 p
(Contracts DAMD17-80-C-0109; DA Proj. 3M6-1102-BS-10)
(AD-A167408; USAARL-86-1) Avail: NTIS HC A02/MF A01 CSCL 06/10

In studies of noise-induced hearing loss in chinchillas, it is necessary to restrain the animal in a known noise field for the duration of the exposure. In studies of continuous noise effects, a small cage in which the subject is free to move about has been used. The orientation of the subject due to the omnidirectional nature of continuous noise effects is not critical due to the omnidirectional nature of the exposure. In contrast, freefield impulse noise is a highly directional sound field by its essential nature. The need to restrain the research subject and fix its orientation relative to the source of the impulse is critical in impulse noise exposures. Only three references were found in the literature about chinchilla restraining devices. These devices were applicable more for routine clinical procedures, administering medication, detecting motion, and collecting motion, and collecting semen for reproduction studies. None were suited for auditory research. This led us to develop the chinchilla restraint system (CRSS). The function of

the CRS is to maintain a chinchilla in a stable, immobile position which can be standardized for all subjects during studies of noise-induced hearing loss. The CRS accomplishes this using the chinchilla's own natural tendencies as a burrowing creature. The CRS provides an artificial burrow in which a chinchilla seems content to remain quiet for extended periods. This report details the design and use of the CRS. GRA

GAS EXCHANGE CHARACTERISTICS OF LEAVES AS INDICATORS OF THE BASIC LIMITATIONS TO THE RATE OF PHOTOSYNTHESIS Annual Report, 1 Jun. 1985 - 31 May 1986
T. D. Sharkey 1986 4 p
(Contract DE-FG08-84ER-13234)
(DE86-009632; DOE/ER-13234/2; AR-2) Avail: NTIS HC A02/MF A01

The response of photosynthesis to light, CO2 and O2 is studied by measuring the exchange of gases (water vapor and CO2) between the atmosphere and the leaf. These measurements are combined with measurements of metabolite levels and enzyme activities which can disclose the molecular events which limit or regulate the rate of photosynthesis. The purpose of this research is to identify the underlying molecular events which give rise to easily measured photosynthetic characteristics so that those processes which are most important in regulating or limiting photosynthesis in leaves can be identified. A significant result of this research has been the identification of the cause of O2 insensitive photosynthesis in C3 plants. It has been determined that this anomalous behavior is caused by deactivation of the primary carboxylating enzyme, RuBP carboxylase, in low O2. It is believed that this deactivation occurs because the plant is unable to use all of the products of photosynthesis that could be made if deactivation did not occur. Current efforts are directed toward understanding how this deactivation may be advantageous to the plant and how rapidly it can occur. DOE

GUARD CELL BIOCHEMISTRY: RESPONSE TO ENVIRONMENTAL STIMULI CAUSING CHANGES IN GAS EXCHANGE
W. H. Outlaw, Jr. 1986 24 p
(Contract DE-AS05-81ER-10803)
(DE86-010287; DOE/ER-10803/5) Avail: NTIS HC A02/MF A01

Our understanding of how the light reactions of photosynthesis influence carbon metabolism in guard cells is rudimentary. This state of affairs is understandable; reliable reports of PS II in guard cells were published only two years ago. At this point, I wish to warn against complacency in drawing strict analogies between guard cell chloroplast function and that in other cells. In general, guard cell chloroplasts and their mesophyll counterparts differ in morphology, for example, the guard cell organelles are smaller, less abundant, and paler, have fewer thylakoids/granna, have areas of peripheral reticulum, and contain relatively more starch. One biochemical difference underlying these morphological ones has already been identified (fluorescence kinetics). DOE

INFLUENCE OF GRAVITY ON STRUCTURE AND BEHAVIOR OF PARAMECIUM CAUDATUM
Ruth Hemmersbach Mar. 1986 69 p
(ESA-TT-963; DFVLR-FB-85-40; ESA-86-98077) Avail: NTIS HC A04/MF A01; German version avail. from DFVLR, Cologne, West Germany DM 27

Paramecium caudatum was used to study the behavior of the contractile vacuolar system, the nutrient uptake, cyclose, multiplication rate, and ultrastructure under simulated weightlessness using a fast-running clinostat and a modified agar method. In comparing 0 and 1 g behavior, no modification is detected, except for the vacuolar system. The slowed and irregular functioning behavior of the contractile vacuolar system due to an inner timing modification is influenced by gravity. Negative geotaxis of Paramecium caudatum is not confirmed. The effects of gravity on the vacuole formation, situation, and number cannot be determined. ESA

A 24-HOUR STRUCTURE OF VIGILANCE UNDER PROLONGED SLEEP DEPRIVATION: RELATIONSHIP WITH PERFORMANCE Final Report, Feb. 1983 - Feb. 1984
Peretz Lavie Mar. 1986 72 p
(Contracts DAJA45-83-C-0047; DA Proj. 2Q1-61102-B-74-D)
(AD-A167399; ARI-RN-86-32) Avail: NTIS HC A04/MF A01 CSCL 06/19

The present study investigated the 36h structure of sleepiness and its relationship with psychomotor performance after 28h of sleep deprivation. Eight subjects, aged 19 to 25 years, participated after spending two adaptation nights in the sleep lab at 2300 and remained deprived of sleep until 1100. At 1100 a schedule of either 7 min sleep attemp in bed, 13 min awake outside the bedroom, or 7 min resisting sleep in bed, 13 min awake outside the bedroom, was begun and maintained for 36h until 23h on the next day. The order of the two experimental conditions, which were separated by two weeks, was counterbalanced. Polyhypnographic recordings were carried out during the 7-min in bed periods, and psychomotor testing (one and two-handed reaction time tasks) was conducted in the middle of the 13-min wake periods. Significant circadian effects were found for the two components of the psychomotor performance: reaction time and movement time. In spite of the great similarity between the circadian variations in sleepiness and the circadian variations in performance, correlating these two variables for 12h blocks revealed random and nonsignificant correlations. This negated a causal relationship between the amount of sleepiness and performance, and suggests that both are modulated by a common underlying circadian oscillator. GRA

ALTITUDE ACCLIMATIZATION (VENTILATION AND CHEMORESPONSIVENESS) DURING WAKEFULNESS AND SLEEP
David P. White, Kevin Gleeson, Cheryl K. Pickett, John T. Reeves, and Anne M. Rannels Apr. 1986 29 p
(AD-A167738; USARIEM-M-28/86) Avail: NTIS HC A03/MF A01 CSCL 06/19

Although the influence of altitude acclimatization on respiration has been carefully studied, the associated changes in hypoxic

and hypercapnic ventilatory responses are the subject of controversy and neither response has been carefully evaluated during sleep at altitude. To answer these questions, six healthy males were studied at sea level and on nights 1, 4, and 7 following arrival at altitude (14,110 ft). During wakefulness ventilation and the ventilatory responses to hypoxia and hypercapnia were determined on each occasion. During both NREM and REM sleep at sea level and on all three nights at altitude, ventilation and the hypercapnic ventilatory response were measured. With acclimatization to high altitude, ventilation increased during both wakefulness and sleep which reflected primarily increasing respiratory frequency. The slope of the hypercapnic response did not rise further with acclimatization although the position of this response shifted significantly to the left during wakefulness and sleep. Finally, sleep induced similar decrements in both ventilation and hypercapnic responsiveness at altitude to those seen at sea level. GRA

SPECIAL FEATURES OF SURGICAL INTERVENTION UNDER CONDITIONS OF WEIGHTLESSNESS
G. L. Yaroshenko, V. G. Terentyev, and M. N. Mokrov 7 May 1986 11 p Transl. into ENGLISH from Voyenno-Meditsinskiy Zhurnal (USSR), no. 10, Oct. 1967 p 69-70
(AD-A167916; FTD-ID(RS)T-0294-86) Avail: NTIS HC A02/MF A01 CSCL 22/1

At present questions of medical support of prolonged space flights acquire fundamental importance. Among these questions together with forecasting of the probable morbidity of cosmonauts urgent/actual is the determination of the possibility of executing of medical manipulations, including surgical intervention under the conditions of weightlessness. It is possible to make following conclusions: Execution of surgical intervention under conditions of weightlessness is possible and is not connected with great difficulties; The probability of pulverizing/atomizing biological fluids, which are located under relatively greater pressure (for example, arterial blood) should be considered; For preventing the pollution/contamination of the atmosphere of the cab during the dissection of tissues, rich in vessels, it is desirable to use hemostatic forceps. Local anesthesia in null gravity is shown. With autopsy of peritoneum strengthening of eventration of intestine is observed. Therefore the autopsy of peritoneum should be conducted step by step, minimally limiting the length of section/cut. With the filling of a syringe with medical solutions, intended for intravenous introduction, one should thoroughly track so that together with solution the air would not fall. GRA

[ACTIVITIES REPORT ON PHYSICAL AND PSYCHOLOGICAL HEALTH OF FLYING PERSONNEL] Annual Report, 1983 [JAARVERSLAG 1983]
1984 45 p In DUTCH
(ESA-86-97385) Avail: NTIS HC A03/MF A01

Activities concerning the physical and psychological health of flying personnel are summarized. A human centrifuge; anthropometric measurements on adolescents; F-16 pilot EEG's; and motion perception sensations with peripherically offered visual stimuli are discussed. Research was done on Meniere patients and rheoencephalographics. Computerized psychodiagnostic methods for pilot and driver aptitude judgements were developed. Airbus cockpit certification methods were evaluated. ESA

SPEECH ANALYSIS BASED ON A MODEL OF THE AUDITORY SYSTEM Final Report, Oct. 1983 - Sep. 1985
Harvey E. Rhody, Robert A. Houde, Charles W. Parkins, and Sohiel Dianat Feb. 1986 54 p
(Contract F30602-81-C-0169)
(AD-A167426; RADC-TR-85-265) Avail: NTIS HC A04/MF A01 CSCL 20/1

This report describes a signal processing technique for speech signals based on a model of the processing done in the auditory system. It has been found that the click response of the auditory system is an exponential function. The spectrogram produced by a speech waveform that has been windowed by the same function possesses excellent resolution of both time and frequency parameters of the signal. It is expected that this analysis method will improve the discrimination of phonemic elements, and will

prove useful in such applications as speech recognition and speech compression. GRA

SPEED OF WORK AND ERROR RATE: ANALYSES OF INDIVIDUAL DIFFERENCES IN A CHOICE REACTION SERIES WITH A COGNITIVE COMPONENT
Klaus-Martin Goeters Dec. 1985 23 p Original language document was announced as N86-10781
(ESA-TT-944; DFVLR-FB-85-21; ESA-86-97579) Avail: NTIS HC A02/MF A01; original German version available from DFVLR, Cologne, West Germany DM 10.50

A visual choice reaction test with a cognitive component was introduced to measure response processes in more detail than is possible with summarizing scoring of paper pencil tests. For each reaction the following information was registered: stimulus (light) reaction (right/wrong), reaction time, and omission (yes/no). Each subject had to react on 320 successive signals without pause. From the reaction protocol of each subject indices for speed of work, oscillation of performance, error disposition, and reaction inhibition were computed. The main results is that in this reaction test speed of work and error disposition are not coupled. Errors are not a consequence of quick reactions. The observed errors seem to be the expression of an increased variation in performance. The results are discussed with a view to a psychophysiological model of activation. ESA

AUDITORY VERSUS VISUAL SELECTIVE-ATTENTION TASKS
L. C. Boer and M. H. B. Ruzius Oct. 1985 27 p
(Contract A83/K/045)
(IZF-1985-19; TDCK-93575; ESA-86-98043) Avail: NTIS HC A03/MF A01

The Dichotic Listening Task (DLT) of Gopher and Kahnemann (1971), which requires subjects to detect targets occurring in one of two messages while ignoring the other, was compared with the Rapid Serial Visual Presentation (RSVP) based on a paradigm of Sperling and Reeves (1980). Subjects were required to detect targets occurring in one of two letter streams while ignoring the other. The performance on DLT and RSVP correlate, but not beyond the basic level between any pair of information processing tasks. Suggestions for RSVP modifications emphasizing selective-attention requirements are considered. ESA

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT

CONTROLLED ENVIRONMENT LIFE SUPPORT SYSTEM: GROWTH STUDIES WITH POTATOES
T. W. Tibbitts and R. M. Wheeler Mar. 1986 52 p
(Contract NCC2-301)
(NASA-CR-177400; NAS 1.26:177400) Avail: NTIS HC A04/MF A01 CSCL 05H

Results of experiments conducted to maximize the productivity of potatoes grown under controlled environmental conditions are discussed. A variety of parameters is examined which affect potato growth, specifically, photoperiod, light intensity, temperature, nitrogen nutrition, carbon dioxide concentration and culture techniques. These experiments were conducted using five different cultivars, Russet Burbank, Norchip, Superior, Kennebec and Norland. To achieve high productivity, three specific objectives were explored: (1) to develop effective cultural procedures, (2) to determine the most effective photoperiod and (3) to develop a mist culture system. It is felt that the productivity obtained in this study is below the maximum that can be obtained. High irradiance levels coupled with tuber-promoting conditions such as cooler temperatures, increased CO_2 levels and lowered nitrogen concentrations should allow increases in tuber production. Tuberization appears to be accelerated by short daylengths although final yields are not increased. Mist culture techniques have not yet produced fully developed tubers. The use of supporting media and alteration of the nitrogen content of the mist solution are being explored as a way to allow tubers to develop to maturity. Author

NASA FACTS: SPACE SHUTTLE FOOD SYSTEMS
1986 15 p
(NF-150/1-86) Avail: Issuing Activity CSCL 06H

On the Space Shuttle, the food is prepared at a galley installed on the Orbiter's mid-deck. The galley is a modular unit that can be removed for special weight-critical missions or missions that require extra interior space. It contains a personal hygiene station, a water dispenser, an oven, condiment and meal tray stowage, and a food preparation area. Foods are individually packaged and stowed for easy handling in the zero gravity of space. All food is precooked or processed so it requires no refrigeration and is either ready to eat or can be prepared simply by adding water or heating. The only exception is the fresh fruit and vegetables stowed in the fresh food locker. The supplies consist of rehydratable food and beverages, thermostabilized food, intermediate moisture foods, natural form foods, irradiated meats, and condiments. A sample menu is also included. ABSOLUTE JUDGMENT VERSUS ABSOLUTE MAGNITUDE ESTIMATION TO CONVEY INFORMATION THROUGH SYMBOL MAGNITUDE CHANGES IN CRT DISPLAYS M.S. Thesis
Bernard Asiu Dec. 1985 75 p
(AD-A167059; AFIT/CI/NR-86-38T) Avail: NTIS HC A04/MF A01 CSCL 09/4

Psychophysical scaling of symbol magnitude to convey information through CRT displays was evaluated in terms of information theory. Series of lines and ellipses each with four, eight and twelve intermediate sizes were presented to twelve subjects under absolute judgment scaling and to an additional twelve subjects under absolute magnitude estimation scaling. Under absolute judgment, information transmission is higher and equivocation and ambiguity measures are lower than those obtained under absolute magnitude estimation. The difference in information transmission represents an increase of about one stimulus alternative under absolute judgement scaling and in itself does not preclude the practical application of absolute magnitude estimation to encode information. Rather it is the wide variability in median magnitude estimations that makes it difficult to reach any common ground for symbol interpretation. Author (GRA)

HUMAN PROBLEM SOLVING IN FAULT DIAGNOSIS TASKS Final Report, Jul. 1979 - Jul. 1982
William B. Rouse and Ruston M. Hunt Apr. 1986 55 p
(Contracts MDA903-79-C-0421; DA Proj. 2Q1-61102-B-74-F)
(AD-A167397; ARI-RN-86-33) Avail: NTIS HC A04/MF A01 CSCL 05/10

This report evaluates the nature of human problem solving abilities specifically related to fault diagnosis situations. Three types of fault diagnosis were analysed involving diagnosis utilizing both real equipment and computer simulated equipment failures. In addition, the investigators experimented with computer generated problem solving aids to supplement human decision making capacities in diagnostic tasks. Results of the initial investigation indicate that human problem solving tends to be highly context-specific but that pattern recognition capabilities are exceptional allowing for a high degree of accuracy in ambiguous problem solving situations. Both structured-oriented and strategy-oriented problem solving aids were analysed. Structured-oriented bookkeeping aids clearly improved performance, while strategy-oriented aids actually had a negative effect on transfer of training. This research

effort is clearly relevant to military interests in effective training of optimal decision making in sub-optimal conditions. The results strongly support further research into the nature and training of effective solving. GRA

STRIVING FOR NATURAL USAGE
N. A. Storch 1986 9 p Presented at the ACM/SIGCHI '86: Human Factors in Computing Systems, Boston, Mass., 16 Apr. 1986
(Contract W-7405-eng-48)
(DE86-009402; UCRL-94415; CONF-8604159-1) Avail: NTIS HC A02/MF A01

During the past year, the Non-Destructive Evaluation Section has supported developing a user environment for their technicians and scientists who do image processing and analysis of images obtained from various sources. In particular, this has involved bringing together certain software tools which already existed into a prototype, trying to understand user needs by observation, discussion, insightful guessing, and then continuing on to build something better. One of the primary goals has been to achieve a natural user interface. The efforts have required internal complexity in handling: pointing of the user to the image or screen and resultant actions, device independent graphics and raster operations, application menus, working image data base and command recognition. These are, for the most part, independent of the image processing functions. Starting from broad, not very well defined requirements, it has become an on-going effort to checkout both interactive and image processing operations. A framework was developed to allow for flexibility in image processing operations and their integration into work-related applications. The results indicate that success in accomplishing an easy, natural usage is due to: commitment and concentration on usage, continual reevaluation during development, and allowance for the overhead of tidying up to maintain internal order and clarity. CONTROL THEORETIC ANALYSIS OF HUMAN OPERATOR MEDIATED RENDEZVOUS AND DOCKING
P. Milgram and P. H. Wewerinke 26 Feb. 1985 10 p Presented at 2nd IFAC/IFIP/IFORS/IEA Conf. on Analysis, Design and Evaluation of Man-Machine Systems, Varese, Italy, 10-12 Sep. 1985
(NLR-MP-85020-U; B8661085; ESA-86-97669) Avail: NTIS HC A02/MF A01

A model based analysis of manual control of space rendezvous and docking in the presence of transmission time delays (nominal case: human operator (HO) on the ground) is presented. The variables studied are time delay, human induced motor noise levels, rotational and translational control and the effect of display prediction. An envelope of performance is estimated, bounded by performance with optimal prediction and performance with no prediction at all. Nominal performance for a simple second order Taylor predictor display is estimated. An HO imperfect internal representation of the system is used to model the no-predictor and predictor display cases. ESA

CONTROL LOOPS WITH HUMAN OPERATORS IN SPACE OPERATIONS. PART 1: HUMAN ENGINEERING ANALYSIS, SYNTHESIS AND EVALUATION TECHNIQUES Final Report
P. Milgram, R. C. vandeGraaff, and P. H. Wewerinke Paris ESA 17 May 1985 280 p
(Contract ESA-5594/83)
(NLR-TR-84116-L-Pt-1; ESA-CR(P)-2190-Pt-1; ESA-86-97787-Pt-1)
Avail: NTIS HC A13/MF A01

Human engineering approaches and methodologies applicable for analysis of performance of human-machine systems, particularly space teleoperator applications, are reviewed. Motivated by the presumed active role of the human operator in future space teleoperation missions, the application of human engineering within the various stages of system development is discussed, emphasizing the impact on the development cycle of being able to analyze various aspects of human-in-the-loop system performance. Experimental and theoretical approaches to human performance analysis are identified. Fundamental and practical aspects of each approach are outlined. A modeling approach for the analysis of a specific class of supervisory space teleoperator missions is proposed. Human-computer task allocation for such missions is considered. ESA

(NASA-TM-86675; A-85103; NAS 1.15:86675) Avail: NTIS HC A06/MF A01 CSCL 09B

Three computer codes were studied which make use of concurrent processing computer architectures in computational fluid dynamics (CFD). The three parallel codes were tested on a two processor multiple-instruction/multiple-data (MIMD) facility at NASA Ames Research Center, and are suggested for efficient parallel computations. The first code is a well-known program which makes use of the Beam and Warming, implicit, approximate factored algorithm. This study demonstrates the parallelism found in a well-known scheme and it achieved speedups exceeding 1.9 on the two processor MIMD test facility. The second code studied made use of an embedded grid scheme which is used to solve problems having complex geometries. The particular application for this study considered an airfoil/flap geometry in an incompressible flow. The scheme eliminates some of the inherent difficulties found in adapting approximate factorization techniques onto MIMD machines and allows the use of chaotic relaxation and asynchronous iteration techniques. The third code studied is an application of overset grids to a supersonic blunt body problem. The code addresses the difficulties encountered when using embedded grids on a compressible, and therefore nonlinear, problem. The complex numerical boundary system associated with overset grids is discussed and several boundary schemes are suggested. A boundary scheme based on the method of characteristics achieved the best results. M.G.

ADA (TRADE NAME) COMPILER VALIDATION SUMMARY REPORT: VERDIX CORPORATION VERDIX ADA DEVELOPMENT SYSTEM, VERSION 5.2 FOR THE TEKTRONIX 6130 UNDER UTEK, RELEASE 2.1.1 Report for 16 Nov. 1985 - 16 Nov. 1986
16 Nov. 1985 76 p
(AD-A166872; AVF-VSR-16.0286) Avail: NTIS HC A05/MF A01 CSCL 09/2

The Validation Summary Report presents the results and conculsions of testing performed on the Verdi Ada Development System (VADS), Version 5.2. Standardized tests serve as input to an Ada (trade name) compiler, producing results which are evaluated by the validation team. This summary briefly states the highlights of the VADS, Version 5.2, validation. On-site testing was performed on 14 Nov 1985 through 16 Nov 1985 at Verdix Corporation in Aloha, Oregon under the auspices of the Ada Validation Facility (AVF), according to Ada Validation Office (AVO) policies and procedures. The VADS, Version 5.2, is hosted on a Tektronix 6130 operating under UTek Operating System, Release 2.1.1. The suite of tests known as the Ada Compiler Validation Capability (ACVC), Version 1.6, was used. The ACVC is used to validate conformance for a compiler to ANSI/MIL-STD-1815A Ada. The purpose of testing is to ensure that a compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, or during execution. GRA

STABILITY CONSIDERATIONS IN THE DESIGN OF SIGMA-DELTA MODULATORS
C. P. Lewis, M. I. Mathew, and A. M. Zikic 1985 10 p
(S-and-C.85-1; ESA-86-97257) Avail: NTIS HC A02/MF A01

A design technique based on the use of z-transform modeling of nonlinear elements transformed into the w-domain was applied to the study of sigma-delta modulators, used in the generation of tracking analog to digital converters. Results show that the w-domain techniques allied to the use of suitable describing function models facilitate the design of sigma-delta modulators. To assist in the maximization of the yield of a system when fabricated, it is essential to use computer design aids for the easy identification of important system parameters and the effect of their variation on system performance. A computer aided design package for this procedure was written. ESA

TOP-DOWN DESIGN OF VLSI MICROPROCESSORS Ph.D. Thesis [CONCEPTION DESCENDANTE APPLIQUEE AUX MICROPROCESSEURS VLSI]
Francois Bertrand 1985 246 p In FRENCH; ENGLISH summary
(ESA-86-97299) Avail: NTIS HC A11/MF A01

An approach based on classical specification and refinement methods to minimize the probability of VLSI design error and to optimize the design choice is presented. The study is supported by the design and implementation of the 80C48 VLSI microprocessor. The main design steps considered include choice of the computation algorithm, choice of the data path, and choice of the control structure. Analysis and simulation are used to validate the design steps. The optimization of the design is partially based on a predictive evaluation. It is shown that a design based on rather large building blocks is advantageous. These functional blocks can be developed, implemented and tested by automatic procedures. ESA

(A-15; ISBN-90-6818-021-5; ESA-86-97765) Copyright. Avail: Issuing Activity

A computer aided design (CAD) - computer aided manufacturing (CAM) modular package was tested. The system is suited for mechanical engineering applications. The hardware and software test configurations are described. After base-figure construction, two-dimensional design manipulations, transformations, reflections, rotations, reductions, and rescalings were executed. Line-strings, edgings, parameterized forms, accuracy, design speed, data storage efficiency, coupling possibilities with FORTRAN programs, and data base management system performance were investigated. An engine, a T-piece with flanges, and a ship's plating were modeled in three dimensions and combined. The two and three-dimensional integration was examined. For numerical control, pump-cylinder elaborations were executed. The package is attractive for a large number of mechanical engineering applications, with certain restrictions. ESA

A RECENT ALGORITHM FOR THE FACTORIZATION OF POLYNOMIALS
Arjen K. Lenstra *In its* CWI Newsletter, No. 8 Sep. 1985 p 15-20 (For primary document see N86-32121 23-61)
Avail: NTIS HC A04/MF A01

A polynomial-time factoring algorithm is presented. Its run time, when applied to a polynomial f in Z(X), is always bounded by a fixed polynomial function of the degree and the coefficient-size of f. The irreducible factors in Z(X) of f can be regarded as the minimal polynomials (in Z(X)) of its roots. Therefore, to find an irreducible factor of f, it suffices to determine the minimal polynomial of one of its roots. The minimal polynomial of a root a of f

immediately follows from an integral linear combination of minimal degree among the powers of a. It is shown that the problem of finding such a relation among the powers of a can be reduced to the problem of finding a relatively short vector in a subset of a real vector space. Such a short vector can then be found by the basis reduction algorithm. ESA

TEXT UNDERSTANDING: INTERESTINGNESS AS A BASIS FOR THE VARIATION OF THE ANALYSIS DEPTH Final Report, Dec. 1984
Hans-Jochen Schneider, Werner Emde, Michael Fuernsinn, Siegfried Guenther, Mohammed Khenkhar, James Kilbury, Kai vonLuck, Claus-Rainer Rollinger, Bernd Ruschkowski, and Albrecht Schmiedel Bonn, West Germany BMFT Dec. 1985 120 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-ID-85-001; ISSN-0170-8996; ESA-86-97435) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 25

Fundamental methods and procedures which enable computers to understand texts were investigated and developed. Aspects of the representation formalism in which natural language knowledge formulated as texts is to be represented were studied. This involved the representation of temporal and uncertain knowledge. The subsequent processing of the representations derived from texts as well as the dynamic construction of knowledge bases were investigaged in the framework of machine learning and nonmonotic deduction. The translation process that assigns a semantic representation to natural language utterances was treated using the Generalized Phrase Structure Grammar formalism. The relation between propositional versus analogical representation was investigated with respect to the solution of spatial problems in a geographical question-answering system. For individual titles, see N86-32125 through N86-32131.

THE SIMULATION OF NATURAL KNOWLEDGE SYSTEMS [ZUR SIMULATION NATUERLICHER WISSENSSYSTEME] c63
Claus-Rainer Rollinger *In its* Text Understanding: Interestingness as a Basis for the Variation of the Analysis Depth Dec. 1985 p 13-21 In GERMAN (For primary document see N86-32124 23-61)
Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 25

The representation formalism in which natural language knowledge is to be represented is discussed. The starting point of artificial intelligence is that intelligent behavior has to be knowledge-based behavior; the central questions are the representation or utilization of knowledge. Natural knowledge systems can be characterized via the human cognitive capabilities. Operational simulation models can be developed to formally represent knowledge, and to verify theories and hypotheses. The difficulties involved in the study of knowledge systems are outlined. The models are always defective since they do not adequately describe reality; therefore they have to be regularly corrected. Essential in the analysis of concrete knowledge systems is the structuring of knowledge into levels of different generality. ESA

MACHINE LEARNING IN METAXA [MASCHINELLES LERNEN IN METAXA] c60
Werner Emde *in its* Text Understanding: Interestingness as a Basis for the Variation of the Analysis Depth Dec. 1985 p 87-115 In GERMAN (For primary document see N86-32124 23-61)
Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 25

A machine learning model for the acquisition of inferential knowledge on the basis of higher concepts is presented. The emphasis is on problems of incremental knowledge acquisition and hence on the concept of validity domains as a basis for machine learning. A model-controlled procedure, METAXA, characterized by the fact that control models in the knowledge acquisition process are heuristically generated is presented. The declarative representation of inferential knowledge as metaknowledge is shown to be an advantage for all the steps in the knowledge acquisition process. Difficulties occurring in the process of (quasi) cumulative knowledge acquisition are treated.

THE NATURE AND EVALUATION OF COMMERCIAL EXPERT SYSTEM BUILDING TOOLS
William B. Gevarter Jun. 1986 27 p
(NASA-TM-88331; A-86321; NAS 1.15:88331) Avail: NTIS HC A03/MF A01 CSCL 09B

This memorandum reviews the factors that constitute an Expert System Building Tool (ESBT) and evaluates current tools in terms of these factors. Evaluation of these tools is based on their structure and their alternative forms of knowledge representation, inference mechanisms and developer/end-user interfaces. Next, functional capabilities, such as diagnosis and design, are related to alternative forms of mechanization. The characteristics and capabilities of existing commercial tools are then reviewed in terms of these criteria.

RESEARCH RELATED TO IMPROVED COMPUTER AIDED DESIGN SOFTWARE PACKAGE Semiannual Status Report, 1 Apr. - 1 Oct. 1986
William H. Walston, Jr. 1986 33 p
(Contract NCC5-33)
(NASA-CR-179668; NAS 1.26:179668) Avail: NTIS HC A03/MF A01 CSCL 09B

The comparative computational efficiencies of the finite element (FEM), boundary element (BEM), and hybrid boundary element-finite element (HVFEM) analysis techniques are evaluated for representative bounded domain interior and unbounded domain exterior problems in elastostatics. Computational efficiency is carefully defined in this study as the computer time required to attain a specified level of solution accuracy. The study found the FEM superior to the BEM for the interior problem, while the reverse was true for the exterior problem. The hybrid analysis technique was found to be comparable or superior to both the FEM and BEM for both the interior and exterior problems.

TREE-STRUCTURED CLASSIFICATION VIA GENERALIZED DISCRIMINANT ANALYSIS Technical Summary Report
Wei-Yin Loh and N. Vanichsetakul Jan. 1986 35 p
(Contract DAAG29-80-C-0041; Grants NSF MCS-83-00140; NSF DMS-85-02303)
(AD-A167453; MRC-TSR-2902) Avail: NTIS HC A03/MF A01 CSCL 09/2

Linear techniques are used recursively to construct classification rules which can be represented as k-nary decision trees. The method has been implemented in a computer program called FACT. It can handle ordered and unordered variables, unequal priors, variable misclassification costs, and missing observations. Besides the tree structure, it also yields an importance ranking of the variables and a cross-validation estimate of error. FACT is compared with CART (a procedure proposed recently by Breiman et al., which gives a binary tree) in a series of examples. The conclusion is that FACT and CART are usually comparable in terms of classification accuracy and interpretative capability, but FACT runs many times faster.

COMPUTING NARROW INCLUSIONS FOR DEFINITE INTEGRALS Technical Summary Report
George F. Corliss Feb. 1986 31 p
(Contract DAAG29-80-C-0041)
(AD-A167491; MRC-TSR-2913) Avail: NTIS HC A03/MF A01 CSCL 09/2

The ACRITH computer program is used to implement algorithms which give narrow inclusions for definite integrals. Inclusions are obtained from familiar numerical quadrature formulas such as Gaussian or Newton-Cotes with remainder terms, or from the term-by-term integration of Taylor polynomials with remainder terms. Inclusions for the remainder terms are computed using automatic differentiation. The inclusions for the remainder terms are computed using automatic differentiation. The inclusions are valid if the integrand or the endpoints of the interval of integration are real-or interval-valued. Interval inclusions which contain only a few machine numbers are achieved by using ACRITH's accurate scalar product, by using order and subinterval adaptation, and by using special devices such as intersection of several estimates. Numerical examples show that such narrow, guaranteed bounds require about four times as long to compute as the estimates computed by the routine QAGS from QUADPACK.

A NEW RESULT IN THE THEORY AND COMPUTATION OF THE LEAST NORM SOLUTION OF A LINEAR PROGRAM Technical Summary Report
Stefano Lucidi Feb. 1986 25 p
(Contract DAAG29-80-C-0041; Grant NSF DCR-84-20963)
(AD-A167515; MRC-TSR-2910) Avail: NTIS HC A02/MF A01 CSCL 09/2

By perturbing properly a linear program to a separable quadratic program it is possible to solve the latter in its dual variable space by iterative techniques such as sparsity-preserving SOR (successive overrelaxation) algorithms. The main result of this paper gives an effective computational criterion to check whether the solutions of the perturbed quadratic programs provide the least 2-norm solution of the original linear program.

ERROR BOUNDS FOR STRONGLY CONVEX PROGRAMS AND (SUPER)LINEARLY CONVERGENT ITERATIVE SCHEMES FOR THE LEAST 2-NORM SOLUTION OF LINEAR PROGRAMS Summary Report
O. L. Mangasarian and R. DeLeone Mar. 1986 21 p
(Contract DAAG29-80-C-0041; Grants NSF DCR-84-20963; AFOSR-ISSA-85-00080)
(AD-A167536; MRC-TSR-2924) Avail: NTIS HC A02/MF A01 CSCL 12/1

We derive bounds on the distance between an arbitrary point and the unique solution of a strongly convex constrained optimization problem in terms of known violations of the optimality conditions of the problem. These bounds are then used to construct

effective schemes for finding the unique smallest solution of very large sparse linear programs. Given an arbitrary point (x,u) in R superscript n x R sub + superscript m, we give bounds on the Euclidean distance between x and the unique solution x-bar to a strongly convex program in terms of the violations of the Karush Kuhn Tucker conditions by the arbitrary point (x, u). These bounds are then used to derive linearly and superlinearly convergent iterative schemes for obtaining the unique least 2-norm solution of a linear program. These schemes can be used effectively in conjunction with the successive overrelaxation methods for solving very large sparse linear programs. GRA

KALMAN FILTER REAL TIME TRACKING USING MICROPROCESSORS AND A NEW LANGUAGE FOR MILITARY SOFTWARE M.S. Thesis
Jose A. F. Ferreira 27 Mar. 1986 244 p
(AD-A167871) Avail: NTIS HC A11/MF A01 CSCL 09/2

A sequential Extended Kalman filter routine, implemented in the C language, is developed for an embedded computer application. The design takes into account the real time constraints imposed by the sampling time of the data. Filter measurements consist of four (4) transit times generated by torpedo instrumentation in a TEST RANGE facility, and they are nonlinear functions of the coordinates of the torpedo. Memory, speed efficiency, and portability are emphasized in the software design. The program was tested, using simulated trajectories, in an IBM-PC and in a CIE 680/30 microcomputers. Limitations in handling small floating point numbers degraded the performance of the algorithm in the CIE machine which could not track 1/4-G maneuvers. GRA

(DE86-010171; LA-UR-86-1179; CONF-8604173-1) Avail: NTIS HC A03/MF A01

In previous work by the authors, the optimum finding properties of Hopfield neural nets were applied to the nets themselves to create a neural compiler. This was done in such a way that the problem of programming the attractors of one neural net (called the Slave net) was expressed as an optimization problem that was in turn solved by a second neural net (the Master net). In this series of papers that approach is extended to programming nets that contain interneurons (sometimes called hidden neurons), and thus deals with nets capable of universal computation. DOE

INTERACTIVE PROGRAMS IN A FUNCTIONAL LANGUAGE. A FUNCTIONAL IMPLEMENTATION OF AN EDITOR
Pieter Koopmann 1985 12 p
(Rept-65; ESA-86-97716) Avail: NTIS HC A02/MF A01

Ease of programming in a functional language was assessed by writing a UNIX-like text editor in SASL. The result is very satisfactory. Once used to the functional style, programming is quite easy. The program itself is significantly more elegant than a program written in an imperative style, while being 10 times as compact. ESA

N86-32154# Nijmegen Univ. (Netherlands). Dept. of Informatics.
TRACING AND DEBUGGING IN SASL
Th. G. A. vanderLee and H. Oolman Apr. 1985 11 p
(Rept-66; ESA-86-97717) Avail: NTIS HC A02/MF A01

A tracer and a debugger for the SASL programming language are presented. The tracing of the functions makes it possible to check the progress of an evaluation. The evaluation order requires adaptation on the part of the programmer. Programmers are so used to applicative order evaluation that the trace of lazy evaluation in normal order combined with call by need appears unexpected

at first. However this adaptation requires little time. The breakpoint mechanism allows inspection of arguments of a function or, if the result is a list, the elements of that list. ESA

PRODUCTION OF CODICOLOGICAL CATALOGS USING COMPUTERS (PCC PROJECT) [PRODUCTIE VAN CODICOLOGISCHE CATALOGI MET BEHULP VAN COMPUTERS (PPC-PROJECT)]
P. F. Beinema, A. J. Geurts, A. Gruijs, C. H. A. Koster, and J. vanKrieken Apr. 1985 76 p In DUTCH
(Rept-67; ESA-86-97718) Avail: NTIS HC A05/MF A01

The possibilities of fast and efficient production of handwriting catalogs using computers were investigated. The description scheme for codices and the description activities are presented. The programming package developed for codicological application is described. An evaluation of the project shows negative results: the programming interface technique, the poor flexibility of PCC-scheme and programming, the required time, the printing facilities, and the poor after-care. Positive results are: codicological innovation, interface diagrams, portability of the programming language to other machines, and two flexible programs. ESA

SYSTEM SEMANTICS AND FORMAL CIRCUIT DESCRIPTION
Raymond T. Boute Aug. 1985 39 p Supersedes Rept-56
(Rept-69; ESA-86-97719) Avail: NTIS HC A03/MF A01

The concept of system semantics, an extension of the denotational theory of programming languages to the description of arbitrary systems is introduced. Application to analog circuits is described. Instead of reasoning on the basis of schematic diagrams, one directly manipulates the circuit descriptions themselves as formulas for various purposes such as correctness proving and the derivation of properties. Properties may range from general theorems of circuit theory, expressed as conversion rules in the language, to special conditions for particular circuits, expressed as equations in the metalanguage. The fact that a single functional language can be used as the metalanguage and at the same time provide the syntax for system description indicates a coherent way for practical implementation. ESA

THE ALGEBRA OF COMMUNICATING PROCESSES WITH EMPTY PROCESS
J. L. M. Vrancken Jan. 1986 60 p Submitted for publication Sponsored by European Economic Commission
(FVI-86-01; B8664355; ESA-86-97745) Avail: NTIS HC A04/MF A01

Axiom systems which are the systems BPA, PA, and ACP extended with the empty process are presented. For the system ACP extension, which contains the other three systems, the most basic supplementary axioms are given, and adapted such that they can deal with the empty process, and a graph model is constructed. The validity of the supplementary axioms is proved in the closed term model and the graph model. ESA

TRANSITION SYSTEMS, METRIC SPACES AND READY SETS IN THE SEMANTICS OF UNIFORM CONCURRENCY
J. W. deBakker, J.-J. Ch. Meyer (Vrije Universiteit, Amsterdam (Netherlands).), E.-R. Olderog (Kiel Univ. (West Germany).), and J. I. Zucker (State Univ. of New York, Buffalo.) Jan. 1986 109 p Submitted for publication Sponsored in part by European Economic Commission
(Grant NSF MCS-80-10728)
(CWI-CS-R8601; B8664600; ESA-86-97751) Avail: NTIS HC A06/MF A01

Transition systems as proposed by Hennessy and Plotkin (1979) are defined for three languages featuring concurrency. The first has shuffle and local nondeterminacy, the second synchronization merge and local nondeterminacy, and the third synchronization merge and global nondeterminacy. The languages are all uniform in the sense that the elementary actions are uninterpreted. Infinte behavior is taken into account and modeled with infinitary languages in the sense of Nivat. A comparison with denotational semantics is provided. For the first two languages, a linear time model suffices; for the third language a branching time model with processes in the sense of De Bakker and Zucker is described. In the comparison an important role is played by an intermediate semantics in the style of Hoare and Olderog's specification oriented semantics. A variant on the notion of ready set is employed here. Precise statements relating the various semantics in terms of abstraction operators are given. ESA

PATTERN REPRESENTATION
P. J. W. tenHagen and C. G. Trienekens Jan. 1986 28 p Sponsored by Netherlands Technology Foundation
(CWI-CS-R8602; B8664601; ESA-86-97752) Avail: NTIS HC A03/MF A01

A method of representing area oriented picture primitives is introduced. The representation aims at efficient conversion of these primitives to frame buffers for raster displays. The representation and the conversion to raster can be the basis for area generators comparable in speed to vector generators used in conventional vector displays. The representation is independent of the type and resolution of raster hardware. As a result interactive graphics on raster display can be of higher quality because of fast responses involving picture change without compromising picture quality. ESA

CONTRASTING THEMES IN THE SEMANTICS OF IMPERATIVE CONCURRENCY
J. W. deBakker, J. N. Kok, J.-J. Ch Meyer, E.-R. Olderog, and J. I. Zucker Jan. 1986 61 p Submitted for publication Sponsored in part by European Economic Commission
(Grants ZWO-125-20-04; NSF MCS-80-10728)
(CWI-CS-R8603; B8664602; ESA-86-97753) Avail: NTIS HC A04/MF A01

Four sample languages for which operational and denotational semantic models are developed are presented. All languages have parallel execution through interleaving, and three have a form of synchronization. Three languages are uniform, i.e., they have uninterpreted elementary actions; the fourth is nonuniform and has assignment, tests and value-passing communication. The operational models build on Hennessy-Plotkin transition systems; as denotational structures both metric spaces and cpo domains are employed. Two forms of nondeterminacy are distinguished, the local and global variety. Linear time versus branching time is investigated. In the former, streams, i.e., finite or infinite sequences of actions; in the latter the (metrically based) notion of process is introduced. Ready sets are used to compare semantics. ESA

Conference on Design Theory for CAD, Tokyo, Japan, 1-3 Oct. 1985 Revised Submitted for publication
(CWI-CS-R8604; B8664603; ESA-86-97754) Avail: NTIS HC A03/MF A01

A hypothesis concerning the physical aspects of designing is introduced to general design theory, and from it theorems useful for computer aided design (CAD) are deduced. In the real knowledge, the design solution is obtained as a cluster point. In the real knowledge, the concept of metamodel which is defined by a set of a finite number of attributes is useful, and it leads to a design process model called evolution model. This design process model can give a reasonable explanation on real design processes. It is possible to give metric to the attribute space in the real knowledge. From general design theory, it is deduced that an extensional description method is more suitable for CAD systems than an intensional one, theoretically, but practically both of them should be combined. PHYSICS CODES ON PARALLEL COMPUTERS
P. G. Eltgroth Dec. 1985 10 p Presented at the Parallel Computing Conference, West Berlin, West Germany, 23 Sep. 1985
(Contract W-7405-eng-48)
(DE86-006712; UCRL-93712; CONF-8509200-3) Avail: NTIS HC A02/MF A01

An effort is under way to develop physics codes which realize the potential of parallel machines. A new explicit algorithm for the

computation of hydrodynamics has been developed which avoids global synchronization entirely. The approach, called the Independent Time Step Method (ITSM), allows each zone to advance at its own pace, determined by local information. The method, coded in FORTRAN, has demonstrated parallelism of greater than 20 on the Denelcor HEP machine. ITSM can also be used to replace current implicit treatments of problems involving diffusion and heat conduction. Four different approaches toward work distribution have been investigated and implemented for the one-dimensional code on the Denelcor HEP. They are self-scheduled, an ASKFOR monitor, a queue of queues monitor, and a distributed ASKFOR monitor. The self-scheduled approach shows the lowest overhead but the poorest speedup. The distributed ASKFOR monitor shows the best speedup and the lowest execution times on the tested problems. DOE

PERFORMANCE MODELLING OF LARGE-GRAINED PARALLELISM
R. L. Crane, M. Minkoff, K. E. Hillstrom, and S. D. King Mar. 1986 32 p
(Contract W-31-109-eng-38)
(DE86-009664; ANL/MCS-TM-63) Avail: NTIS HC A03/MF A01

Mathematical modelling, computer simulation, and graphical methods are used to analyze the performance of parallel computers. Speedup is used as a performance measure. Large-grained parallel computation is considered, i.e., the case in which multiple tasks each involving substantial computation are executed concurrently. A variable-length task involving the solution of a set of ordinary differential equations is defined and used to validate the performance models that are developed. Experimental results are shown for two machines, a Denelcor HEP with a single process execution module, and an Alliant FX/8. DOE

PRACTICAL PARADIGM FOR PARALLEL PROCESSING PROBLEMS
G. S. Davidson Mar. 1986 16 p
(Contract DE-AC04-76DP-00789)
(DE86-009274; SAND-85-2389) Avail: NTIS HC A02/MF A01

Data flow computers achieve high performance by keeping as many processing elements busy as possible for a given algorithm. However, without specialized architectures, the synchronization overhead of data-driven computations can prevent significant speedup. To address this problem, the concept of task flow is developed for more general purpose multiprocessors. Task flow differs from data flow in the amount of computation between synchronizations (at the expense of some parallelism). A software technique is described that implements task flow for general purpose multiprocessors with local and shared memories. A SANDAC-IV multiprocessor example of this technique is given, together with timing results. DOE

SPARSE CHOLESKY FACTORIZATION ON A LOCAL-MEMORY MULTIPROCESSOR
A. George, M. T. Heath, J. Liu, and E. Ng Apr. 1986 22 p
(Contract DE-AC05-84OR-21400)
(DE86-010082; ORNL/TM-9962) Avail: NTIS HC A02/MF A01

The problem of factoring a large sparse positive definite matrix is implemented on a multiprocessor system. The processors are assumed to have substantial local memory but no globally shared memory. They communicate among themselves and with a host processor through message passing. The primary interest is in designing an algorithm which exploits parallelism, rather than in exploiting features of the underlying topology of the hardware. However, part of the study is aimed at determining, for certain sparse matrix problems, whether hardware based on the binary hypercube topology adequately supports the communication requirements for such problems. Numerical results from experiments running on a multiprocessor simulator are included. DOE

N86-32174# Los Alamos National Lab., N. Mex.
HYPERCUBE PROJECT AND A SIMULATOR FOR A HYPERCUBE OF COMPUTERS
J. P. Hong, R. D. Tomlinson, N. Patel, and L. H. Pollard 1985 9 p Presented at the Conference on Hypercube Microprocessors, Knoxville, Tenn., 1 Aug. 1985
(Contract W-7405-eng-36)
(DE86-010164; LA-UR-86-1151; CONF-8508173-1) Avail: NTIS HC A02/MF A01

The Los Alamos National Laboratory and the University of New Mexico are working on HC, a hypercube project for large problems. A hypercube of 1024 nodes is being designed; implementation of a machine of at least 16 nodes is underway. The nodes of the machine are complete computer systems, including mass storage and a large main memory. The computational abilities of each node are enhanced by using a detached instruction fetch-execute-store organization. This allows the execution rate to achieve a consistently high level, approaching 90% of optimum. Trade-offs in the implementation methods indicate the speeds available with acceptable hardware investments. A simulator has been written which allows execution of high level programs on a hypercube organization. The simulator has shown that programs prepared for execution on a single stream machine can be easily modified to use the resources of a parallel machine, and that the results are identical to previous executions. Cyrano is a thoughtful reimplementation of Lenat's controversial Eurisko computer program, designed to perform automated discovery and concept formation in a variety of technical fields. The thought in the reimplementation has come from several directions: and appeal to basic principles, which led to identifying constraints of modularity and consistency on the design of discovery systems; an appeal to transparency, which led to collapsing more and more of the control structure into the representation; and an appeal to accountability, which led to the explicit specification of dependencies in the concept formation

process. The process of reimplementing Lenat's work has already revealed several insights in the nature of Eurisko-like systems in general these insights are incorporated into the design of Cyrano. Foremost among these new insights is the characterization of Eurisko-like systems (which I call inquisitive systems) as search processes which dynamically reconfigure their search space by the formation of new concepts and representations. This insight reveals requirements for modularity and consistency in the definition of new concepts and representations. Author (GRA)

PERFORMANCE ANALYSIS OF A MICROCOMPUTER-BASED SINGLE-LOOP DIGITAL CONTROL SYSTEM Final Technical Report, Aug. 1982 - Aug. 1984
Michael J. Gauder Apr. 1986 81 p
(AD-A167914; AFWAL-TR-85-2074) Avail: NTIS HC A05/MF A01 CSCL 09/5

Digital control system design has been popular in the aerospace and process control industries. Advances in microprocessor technologies have added new growth to this popularity. The use of microprocessor-based systems for control purpose places demands on digital control theory. Since microprocessors are relatively slow digital machines and usually have small work lengthe, it is necessary to place importance on the effects of time delays and amplitude quantization with respect to the control system. The wind length and speed of the signal processing components; Analog-to-Digital (A/D) and Digital-to-Analog (D/A) converters placed additional constraints on the digital control system performance. In order to be able to analyze the effects of constraints that are involved in microprocessor-based control system design, it will be necessary to develop a basic system and a set of procedures that are modifiable to a variety of control configurations. The subject of this thesis is the design, development, and analysis of a 16-bit microprocessor based digital control system. The purpose of the study is threefold: (1) To show that a hybrid computer system, consisting of 16-bit single board microcomputer and an analog computer, can be used effectively for digital control studies; (2) To evaluate the frequency response of the hybrid system; and (3) To identify and evaluate the error contributors which can effect the performance of digital control systems. OPTIMAL CONTROL FOR PARABOLIC-HYPERBOLIC SYSTEM WITH TIME DELAY
A. Kowalewski Jul. 1985 16 p
(DE86-701709; IC-85/70) Avail: NTIS (US Sales Only) HC A02/MF A01

In this paper we consider an optimal control problem for a system described by a linear partial differential equation of the parabolic-hyperbolic type with time delay in the state. The right-hand side of this equation and the initial conditions are not continuous functions usually, but they are measurable functions belonging to L(2) or Lsup(infinity) spaces. Therefore, the solution of this equation is given by a certain Sobolev space. The time delay in the state is constant, but it can also be a function of time. The control time T is fixed in our problem. Making use of the Milutin-Dubovicki theorem, necessary and sufficient conditions of optimality with the quadratic performance functional and constrained control are derived for the Dirichlet problem. The flow chart of the algorithm which can be used in the numerical solving of certain optimization problems for distributed systems is also presented. DOE

TWO ALGORITHMS FOR THE CONSTRUCTION OF GREATEST RIGHT DIVISORS OF A POLYNOMIAL MATRIX M.S. Thesis
G. Zwaan May 1984 97 p
(ESA-86-97302) Avail: Issuing Activity

A linear system of ordinary differential equations over a frequency domain is considered. Two algorithms (Silverman-Van Dooren algorithm and Emre algorithm) for the construction of greatest right divisor (GRD) of polynomial matrix to the system taking the Laplace transformation are studied. Numerical results for the construction of right matrix-fraction description (MFD) and left MFD for the transfer function matrix (rational matrix), are given. ESA

EFFICIENT HIGH ORDER ALGORITHMS FOR ELLIPTIC BOUNDARY VALUE PROBLEMS USING FULL MULTIGRID TECHNIQUES TOGETHER WITH EXTRAPOLATION METHODS
Anton Schueller and Qun Lin Dec. 1985 17 p
(GMD-192; ISSN-0723-0508; ESA-86-97475) Copyright. Avail: Issuing Activity

Three efficient algorithms for accelerating the convergence of linear elliptic second order differential operator in boundary value problems using multigrid techniques (nested iteration), are presented. The extrapolation techniques are applied to finite difference methods. The Ricard extrapolation, splitting extrapolation and local discretization error extrapolation are compared. Numerical tests for two examples are given. ESA

LEAST SQUARES FINITE ELEMENT SIMULATION OF TRANSONIC FLOWS Final Report
T. F. Chen and G. J. Fix May 1986 29 p Submitted for publication
(Contract NAS1-17070)
(NASA-CR-178121; NAS 1.26:178121; ICASE-86-27) Avail: NTIS HC A03/MF A01 CSCL 12A

Finite difference approximation of transonic flow problems is a well-developed and largely successful approach. Nevertheless, there is still a real need to develop finite element methods for applications arising from fluid-structure interactions and problems with complicated boundaries. In this paper a least squares based finite element scheme is introduced. It is shown that, if suitably formulated, such an approach can lead to physically meaningful results. Bottlenecks that arise from such schemes are also discussed. Author

STABILITY ANALYSIS OF INTERMEDIATE BOUNDARY CONDITIONS IN APPROXIMATE FACTORIZATION SCHEMES Final Report
Jerry C. South, Jr., Mohammed M. Hafez (California Univ., Davis.), and David Gottlieb (Brown Univ., Providence, R. I.) May 1986 28 p Submitted for publication
(Contracts NAS1-17070; NAS1-18107; Grant AF-AFOSR-0303-85)
(NASA-CR-178126; ICASE-86-36; NAS 1.26:178126) Avail: NTIS HC A03/MF A01 CSCL 12A

The paper discusses the role of the intermediate boundary condition in the AF2 scheme used by Holst for simulation of the transonic full potential equation. It is shown that the treatment suggested by Holst led to a restriction on the time step and ways to overcome this restriction are suggested. The discussion is based on the theory developed by Gustafsson, Kreiss, and Sundstrom and also on the von Neumann method. Author

ORBITAL COMPACTNESS AND ASYMPTOTIC BEHAVIOR OF NON-LINEAR PARABOLIC SYSTEMS WITH FUNCTIONALS Technical Summary Report
Reinhard Redlinger Jan. 1986 29 p
(Contract DAAG29-80-C-0041)
(AD-A167486; MRC-TSR-2897) Avail: NTIS HC A03/MF A01 CSCL 12/1

In recent years, reaction-diffusion systems have become widely used as models in biology, chemistry and population dynamics. A major point of interest is the long-time behavior of the solutions. For systems governed by ordinary differential equations the asymptotic behavior is usually investigated using Liapunov functionals in conjunction with an invariance principle. The purpose of this paper is to extend these methods to a general class of distributed systems that admit possible hysteresis effects in the reaction mechanism. GRA

ON THE THEOREM OF WEINSTEIN Summary Report
Paul H. Rabinowitz Feb. 1986 18 p
(Contract DAAG29-80-C-0041; Grant NSF MCS81-10556)
(AD-A167492; MRC-TSR-2912) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper contains an existence theorem for a special class of periodic solutions of Hamiltonian systems and generalizes an earlier result of the same nature due to Weinstein. He studied a general class of mechanical systems and established the existence of special kinds of periodic solutions which he called brake orbits. Roughly speaking these solutions start at the boundary of a potential well with 0 velocity and return to the edge of the well, again with 0 velocity, a half period later. This paper contains a generalization of his results using minimax methods form the calculus of variations as the existence tool. GRA

OPTIMAL IMPLEMENTATION OF DIFFERENTIATION ARITHMETIC Summary Report
L. B. Rall Mar. 1986 18 p
(Contract DAAG29-80-C-0041)
(AD-A167494; MRC-TSR-2920) Avail: NTIS HC A02/MF A01 CSCL 12/1

Differentiation arithmetic is an ordered-pair arithmetic which evaluates both the value and derivative of functions defined by formulas or subroutines, without symbolics or approximations. As in the case of complex arithmetic, multiplication and division are defined in terms of several real operations. Algorithms are given for evaluation of these operations with the same accuracy as real multiplication and division, that is, to the closest floating-point number. The same kind of optimal implementation is described for Taylor arithmetic, which permits calculation of Taylor coefficients of arbitrary order for functions defined by formulas or subroutines. FINITE DIFFERENCE METHODS FOR POLAR COORDINATE SYSTEMS Technical Summary Report
John C. Strikwerda and Yvonne Nagel Apr. 1986 21 p
(Contracts DAAG29-80-C-0041; N00014-84-K-0454)
(AD-A167512; MRC-TSR-2934) Avail: NTIS HC A02/MF A01 CSCL 12/1

This document discusses finite difference methods for partial differential equations on polar and spherical coordinate systems. The distinctive feature of these coordinate systems is the coordinate system singularity at the origin. The authors show how to accurately and conveniently determine the solution at the origin for both scalar and vector fields. They also discuss the Fourier method to approximate derivatives with respect to the angular variable in polar coordinates. Computational examples are presented illustrating the accuracy and efficiency of the method for hyperbolic and elliptic equations, and also for the computation of vector fields at the origin. GRA

THE COMPUTATIONAL COST OF SIMPLEX SPLINE FUNCTIONS Technical Summary Report
Thomas A. Grandine Mar. 1986 12 p
(Contract DAAG29-80-C-0041; Grant NSF DMS-82-10950)
(AD-A167513; MRC-TSR-2926) Avail: NTIS HC A02/MF A01 CSCL 12/1

All computational schemes for simplex spline functions to date rely both on the recurrence relation for these functions and the standard construction of the simplex spline basis. Under these conditions, for numerical methods for computing simplex spline functions to be a useful as possible, it is necessary to find ways of implementing the recurrence relation as efficiently as possible. This paper shows that as efficiently as possible is still not very efficient. This implies that truly fast algorithms (which have not yet been developed) will have to either abandon the recurrence relation or the standard construction of the simplex spline basis. GRA

POINTWISE A-PRIORI BOUNDS FOR STRONGLY COUPLED SEMILINEAR PARABOLIC SYSTEMS Summary Report
Reinhard Redlinger Mar. 1986 13 p
(Contract DAAG29-80-C-0041)
(AD-A167539; MRC-TSR-2925) Avail: NTIS HC A02/MF A01 CSCL 20/13

The prototype parabolic partial differential equation is the heat conduction equation. This paper deals with systems of parabolic equations. Such systems occur in many contexts in addition to heat conduction, e.g., biology, in nuclear reactor techniques, in economics, etc. Let the n-vector u denote the (unknown) solution of a system of n parabolic partial differential equations. An important question in the study of these systems is the boundedness of u. Many techniques and criteria have been developed to solve this problem if the system is weakly coupled, i.e., if the k sub th equation contains second order space derivatives of only u sub k, the k sub th component of u. If this is not the case, the system is said to be strongly coupled. This paper for a broad class of strongly

coupled parabolic systems pointwise boundedness of the solution u is established. GRA

PAINLEVE TEST FOR THE COMPLETE INTEGRABILITY OF BOGOMOLNY'S MONOPOLE EQUATION
A. RoyChowdhury and P. K. Chanda Sep. 1984 7 p
(DE85-703173; IC-84/176) Avail: NTIS (US Sales Only) HC A02/MF A01

We have made an analysis of the monopole equation of Bogomolny from the standpoint of Painleve test. The idea that any nonlinear partial differential equation admitting a Lax representation should conform to the criterion of the Painleve analysis seems to hold well in case of the Bogomolny equation. We have determined the position for resonances and have proved that at each of these the coefficients in the Forbenius type expansion of the gauge potentials do become arbitrary signalling the complete integrability of the system. DOE

INVESTIGATION OF THE MOVING FINITE ELEMENT METHOD AS PROPOSED BY A.J. WATHEN
R. F. Sincovec and S. Aslam 26 Feb. 1986 69 p Prepared for Lawrence Livermore National Lab., Calif.
(Contract W-7405-eng-48)
(DE86-009685; UCRL-15793) Avail: NTIS HC A04/MF A01

The Moving Finite Element (MFE) method is investigated for solving non-linear Partial Differential Equations (PDE's) in one dimension with particular emphasis on equations that develop steep fronts and shocks. The MFE method allows the computational finite element mesh to continuously move and adjust with time in order to be able to resolve such sharp features. Degeneracies arising from lack of curvature and element folding can lead to an indeterminate system of MFE equations. Two methods for handling these degeneracies are explored. One requires the use of penalty functions while the other provides a simple scheme for treating such degeneracies. Implicit and explicit time stepping procedures for solving the MFE equations are investigated. For systems of equations, use of one moving mesh for all components and separate moving mesh for each component is explored. DOE

N86-32201# Sandia National Labs., Albuquerque, N. Mex.
SOME EXPERIMENTS WITH NUMERICAL PIVOTING IN A CODE FOR SOLVING LARGE SPARSE STIFF SYSTEMS OF ODES
D. E. Salane Apr. 1986 17 p
(Contract DE-AC04-76DP-00789)
(DE86-010305; SAND-86-0716) Avail: NTIS HC A02/MF A01

The effect of pivoting in a code is examined for the solution of large sparse stiff systems of odes. Experiments with a recent code (DEBDFS) are presented. These experiments indicate that some pivoting for numerical stability is essential in these codes. DOE

N86-32202# Paraiba Univ., Joao Pessoa (Brazil). Dept. de Fisica.
EQUIVALENCE BETWEEN THE METHODS INVOLVING FOURIER SERIES AND THE POISSON'S SUMMATION FORMULA AND EVALUATION OF A CLASS OF LATTICE SUMS IN ARBITRARY DIMENSIONS
M. Dias and A. N. Chaba 1985 9 p
(DE86-701919; UFPB-DF-10/85) Avail: NTIS (US Sales Only) HC A02/MF A01

The similarities between the Fourier series method and the Poisson's summation formula method are brought out by evaluating the lattice sum g(vector r) is the definitonal identity of the summation of vector tau exp(-lambda times the absolute value of vector r - vector tau)/the absolute value of vector r - vector tau over a Bravois lattice /vector tau/ in three dimensions, lambda and vector r being independent of vector tau. It is shown that the two approaches are actually equivalent by proving that the Poisson's summation formula (in any dimensionality) can, itself, be derived from the Fourier series method. An expression is also presented, ready for quick use, for a class of lattice sums, the summation of vector tau F(the absolute value of vector r - vector tau) over a Bravois lattice /vector tau/ in arbitrary dimensions. DOE

N86-32203# Paraiba Univ., Joao Pessoa (Brazil). Dept. de Fisica.
ON THE GENERATION OF EQUIVALENT HAMILTONIANS
O. Espindola, N. L. Teixeira, and M. L. Espindola 1985 4 p
(DE86-701920; UFPB-DF-12/85) Avail: NTIS (US Sales Only) HC A02/MF A01

A new approach to the equivalence problem (in phase space) is presented. Given a Hamiltonian describing a system of particles with two degrees of freedom (and the corresponding Hamilton-Jacobi equation), it is shown how to find the most general new Hamilton-Jacobi equation with the following (and essential) characteristic, here defined as equivalence: every new solution is also a solution of the original Hamilton-Jacobi equations and vice-versa. DOE

N86-32204# Technische Hogeschool Twente, Enschede (Netherlands). Dept. of Applied Mathematics.
ONE-PARAMETER FAMILIES OF OPTIMIZATION PROBLEMS: EQUALITY CONSTRAINTS, 2
H. Th. Jongen, P. Jonker, and F. Twilt 1984 25 p Extended version
(Memo-420; ESA-86-97359) Avail: NTIS HC A02/MF A01

A differentiable optimization problem under generic regularity conditions is studied. The critical points in parametric optimization are generalized. This method can be extended to problems with inequality constraints. ESA

TRUNCATED CARDINAL SPLINE FUNCTIONS Ph.D. Thesis [FONCTIONS SPLINE CARDINALES TRONQUEES]
Rekha Panditrao Kulkarni 1985 162 p In FRENCH
(ESA-86-97284) Avail: NTIS HC A08/MF A01

The development of an optimal algorithm, in the sense of minimal cost and memory occupation, which has at the same time a high order of convergence, is investigated. It is shown that boundary conditions can be chosen to obtain such an algorithm. The boundary conditions proposed by Laurent are discussed. By choice of parameters the inverse of the Toplitz three diagonal matrix is reduced to a simple form. The truncation of the infinite sums leaves a truncated cardinal spline function, and the way to compensate for the truncation error is described. The technique used is applicable to polynomial spline functions of any degree. ESA

N86-32206# Grenoble-1 Univ. (France).
FLOW AND CYCLE COVERING IN GRAPHS AND MATROIDS Ph.D. Thesis [FLOTS ET COUVERTURES PAR DES CYCLES DANS LES GRAPHES ET LES MATROIDES]
Andre Raspaud 1985 120 p In FRENCH
(ESA-86-97285) Avail: NTIS HC A06/MF A01

Given a graph without isthmuses, the problem of finding the shortest length of cycle covering is studied. The Tarsi generalization of cycle covering to regular matroids is reviewed. The existence of non zero flows in a graph allows the improvement of the computation of a minimum length of cycle covering. Non zero flows are defined in binary spaces, for which the improvement is computed without reference to the orientation concept. The general problem of the existance of non zero flows is approached without using the maximum tree concept. The existence for the case of a four edges connected graph is proved. ESA

N86-32207# Grenoble-1 Univ. (France).
SPLINE FUNCTIONS WITH FORM CONDITIONS Ph.D. Thesis [FONCTIONS SPLINES AVEC CONDITIONS DE FORME]
Julio Medina 1985 277 p In FRENCH
(ESA-86-97286) Avail: NTIS HC A13/MF A01

The data interpolation and data smoothing problems are studied

for the case where form conditions are imposed, including positivity, monotony and convexity. The investigated methods include polynomial splines, rational splines, splines under tension, mathematical programming and splines with a rejection device. The smoothing problem is treated using a variational approach. The advantages offered by selected spline functions are shown. ESA

POLYNOMIAL MATRICES AND FEEDBACK
Rikus Eising Mar. 1984 21 p
(Memo-COSOR-84-01; ESA-86-97308) Avail: NTIS HC A02/MF A01

A numerically reliable method for the construction of a feedback matrix solving the generalized deadbeat control problem is presented. The method of total unimodularity of the corresponding technology matrix, which implies integer solution, is used. The use of feedback with respect to polynomial matrix constructions is described. Good and bad solutions with respect to singular values are discussed. ESA

N86-32212# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Mathematics and Computer Science.
AN ALGORITHM FOR THE EVALUATION OF PERFORMANCE MEASURES IN A CP-TERMINAL SYSTEM
J. B. M. vanDoremalen Nov. 1984 20 p
(Memo-COSOR-84-07; ESA-86-97310) Avail: NTIS HC A02/MF A01

The measures in a CP-terminal with stochastically independent thinktimes which are negative exponentially distributed, and the service times for jobs stochastically independent are considered. An algorithm for evaluation of performance measures in a CP-terminal system with preemptive resume priorities is discussed. The recursive scheme is used. ESA

N86-32213# Technische Hogeschool Twente, Enschede (Netherlands). Center for Theoretical Physics.
BREAK-UP OF INVARIANT CIRCLES FOR A MAPPING WITH A CUBIC NONLINEARITY
Cornelis Huiszoon Jul. 1984 21 p Sponsored by Stichting Hogeschoolfonds Twente, The Netherlands, K.I.V.I., and Physical Dynamics Inc., San Diego, Calif.
(Contract DE-AC03-77ER0153S)
(ESA-86-97378) Avail: NTIS HC A02/MF A01

The Poincare surface of section map (PSSM) for an energy conserving system with two degrees of freedom is considered. A constant value C, which a particular invariant circle of PSSM breaks, is determined. The symmetry properties of PSSM are given. A FORTRAN-77 code for estimating C values is listed. ESA

N86-32214# Fraunhofer-Inst. fuer Betriebsfestigkeit, Darmstadt (West Germany).
SEPARATION OF SUPPOSED STRESS-TIME FUNCTIONS BY FILTERING WITH VARIABLE CRITICAL FREQUENCY [TRENNUNG UEBERLAGERTER BEANSPRUCHUNGS-ZEIT-FUNKTIONEN DURCH FILTERUNG MIT VARIABLE GRENZ-FREQUENZ]
H. Klaetschke and H. Steinhilber 10 May 1985 34 p In GERMAN
(LBF-TB-174; ISSN-0721-5320; ESA-86-97414) Avail: NTIS HC A03/MF A01

A digital filter whose critical frequency can be controlled by the evolution of the stress within limits given by the user was developed and tested to separate the parts of stress-time functions according to their origin. The development of methods for the systematic generation of control signals for strength tests with servohydraulic machines using frequency filtering is discussed. The realization of variable critical frequencies is presented. Signal separation is explained by low and high pass filtering. Tests show that good results can be obtained with this method, even in difficult cases such as stepwise stress changes. ESA

ON ASYMPTOTIC ERROR ESTIMATES FOR THE COMBINED BOUNDARY AND FINITE ELEMENT METHOD
Wolfgang L. Wendland Sep. 1985 16 p Submitted for publication
(Preprint-929; ESA-86-97427) Avail: NTIS HC A02/MF A01

The asymptotic error estimates for combined finite element method (FEM) and boundary element method (BEM) are considered. This approach is applied to general equations and other problems when the coupling operator between FEM and BEM is the identity modulo of compact perturbations. ESA

N86-32216# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
WHY THE STRAIGHTFORWARD METHOD OF ANTITHETIC VARIATES IS SO DISAPPOINTING IN PRACTICE
Johannes H. J. Geurts Mar. 1985 18 p
(ESA-86-97694) Avail: NTIS HC A02/MF A01

The effect of stochastic variables on systems simulation models (e.g., time between failures of a machine in a job shop) is discussed. Examples where the response consists of a number that is the direct result of passing a single random number through a sequence of monotonic transformations (the simulation model) are analyzed. Results show that the success of the straightforward application of the antithetic method depends on how well the initial pairwise symmetry of antithetic uniform random variables survives the concatenation of transformations that constitute a simulation model. Even in simple examples results are less than hoped for. In realistic simulation models straightforward application of the antithetic method cannot guarantee an appreciable reduction of the variance

of the estimate of the mean response. Whether a reduction can be achieved at all has to be determined experimentally in each individual case. ESA

N86-32217# Nijmegen Univ. (Netherlands). Dept. of Informatics.
FUNCTIONAL TEMPORAL CALCULUS VERSUS TEMPORAL LOGIC: AN ENGINEERING APPROACH
Raymond T. Boute Mar. 1985 29 p
(Rept-59; ESA-86-97713) Avail: NTIS HC A03/MF A01

It is demonstrated that functional temporal calculus directly merges with the formalisms used in system theory, communication theory, stochastic processes, and concurrent programming. Functions, predicates, and logical operators are defined by natural extension from mappings between value domains to mappings between so-called temporal domains. The modal operators of temporal logic are replaced by temporal combinators (second-order functions) defined directly as mappings between temporal domains. With this semantic formulation, the usual model-theoretic arguments and the distinction between validity and provability are replaced by arguments in standard (nonmodal) logic, while retaining all advantages of temporal logic, particularly the possibility of dealing with time implicity. The demonstration of this correspondence leads to redefinitions of concepts from temporal logic, constituting a nontrivial generalization of their syntactic counterparts. The flexibility of the semantic formulation leads to extensions such as continuous-time temporal calculus. ESA

READY TRACE SEMANTICS FOR PROCESS ALGEBRA WITH PRIORITY OPERATOR [READY TRACE SEMANTIEK VOOR PROCESALGEBRA MET PRIORITEITSOPERATOR]
J. C. M. Baeten, J. A. Bergstra, and J. W. Klop Dec. 1985 12 p In DUTCH Submitted for publication Sponsored by European Economics Commission ESPRIT Project 432
(FVI-85-15; B8660719; ESA-86-97744) Avail: NTIS HC A02/MF A01

A semantics for processes between bisimulation semantics and ready semantics is presented. The advantage of this semantics, while still being as simple as ready semantics, is that it allows the user to define the mechanism in which atomic actions have priority. It is shown that in ready semantics (and a fortiori in failure semantics) such an extension is not possible. Only ready trace semantics in concrete process algebra are considered, and thus not abstractness and quiet step. Only finite processes are considered. A complete axiomatization of ready trace semantics is given. ESA

EVALUATION OF SOME FIBONACCI AND LUCAS SERIES VIA CERTAIN FUNCTIONS OF THE Q MATRIX
Piero Filipponi Oct. 1985 12 p
(FUB-23-1985; ESA-86-97886) Avail: NTIS HC A02/MF A01

The analysis supposes a two by two matrix X, the entries of the successive powers of which are related to certain Fibonnaci or Lucas numbers. The X matrix is strictly related to the well known Q matrix. The functions exp X, sin X, cos X, sinh X, cosh X, inverse X and ln X are considered. The polynomial representation of function of two by two matrices with distinct eigenvalues is examined. The results obtained for each case are presented. ESA

N86-32220# Center for Mathematics and Computer Science, Amsterdam (Netherlands). Dept. of Mathematical Statistics.
ELEMENTARY SYMMETRIC POLYNOMIALS OF INCREASING ORDER
A. J. vanEs and R. Helmers Jan. 1986 13 p
(CWI-MS-R8601; B8664687; ESA-86-98053) Avail: NTIS HC A02/MF A01

The asymptotic behavior of elementary symmetric polynomials Sn of order k, based on n independent and identically distributed random variables X1, ..., Xn, is investigated for the case that both k and n get large. If k = Omicron (sq root n) the distribution function of a suitably normalized Sn of order k is shown to converge to a standard normal limit. The speed of this convergence to normality is of order 0 (k sq root n) if k = O (log (-1) n log2 (-1) n sq root n) and natural moment assumptions are imposed. This order bound is sharp, and cannot be inferred from one of the existing Berry-Esseen bounds for U-statistics. If k tends to infinity at the rate sq root n, then a non-normal weak limit appears, if the Xj's are positive and Sn(k) is standardized appropriately. If k tends to infinity at a rate faster than sq root n, it is shown that for positive Xj's there exists no linear norming which causes Sn(k) to converge weakly to a nondegenerate weak limit. ESA

STATISTICAL ANALYSIS OF NONHOMOGENEOUS POISSON PROCESSES Ph.D. Thesis [ANALYSE STATISTIQUE DE PROCESSUS DE POISSON SPATIAUX ET NON HOMOGENE]
In its Statistical Analysis of Nonhomogeneous Poisson Processes. Statistical Treatment of a Particle Multidetector 1985 p 1-47 In FRENCH (For primary document see N86-32221 23-65)
Avail: NTIS HC A07/MF A01

A procedure to test the intensity of nonhomogeneous Poisson processes is presented. The test defined by Mark Brown is generalized to the set of Radon measures. The necessary and sufficient conditions for the existence of the Radon-Nikodym derivative of one or another Poisson law are investigated. The Neyman-Pearson theorem provides a solution to the hypothses test problem. It is proved that a multiple hypothesis test can be defined, and the conditions for which the test statistics are normal asymptotic are established. ESA

Avail: NTIS HC A07/MF A01

The estimation of diffracted intensities from the diagrams obtained using a neutron diffractometer for monocrystals is studied. The instrument is gas filled, multifilament, with 64 anodes and 16 cathodes. The diffraction diagram is two dimensional over 1024 measuring points. The procedures to test the homogeneity and stability of the counting process are developed using a homogeneous flow of particles. The computation of the diffracted intensities

is done using two different methods depending on the background noise level. A nonhomogeneous Poisson process model is adopted. The computer program and the numerical results are included.

UPPER BOUNDS ON POISSON TAIL PROBABILITIES Summary Report
Peter W. Glynn Apr. 1986 13 p
(Contract DAAG29-80-C-0041; Grants NSF ECS-84-04809; NSF DMS-82-10950)
(AD-A167531; MRC-TSR-2931) Avail: NTIS HC A02/MF A01 CSCL 12/1

Let p(k) = exp(-lambda) lamda sub k/k (k= 0,1,...) be the Poisson mass function. In a variety of application contexts, it is necessary to computer infinite sums involving these probabilities. For example, such sums occur naturally in numerical algorithms developed for Poisson variate generation purposes and for computing terminal rewards of uniformizable continuous-time Markov chains. From a practical standpoint, it is necessary to truncate these infinite sums after a finite number of terms. Development of a priori error bounds on the error incurred by this kind of truncation requires bounds on the left and right tails of the Poisson distribution; such bounds are given here. These bounds are easily computable in a numerically stable way, even when the Poisson parameter lambda is large.

THE CENTRAL LIMIT THEOREM AND POINCARE-TYPE INEQUALITIES Summary Report
Louis H. Y. Chen Apr. 1986 13 p
(Contract DAAG29-80-C-0041)
(AD-A167534; MRC-TSR-2929) Avail: NTIS HC A02/MF A01 CSCL 12/1

We use Poincare type inequalities to prove the sufficiency and necessity of the Lindeberg condition in the central limit theorem. The central limit theorem is a fundamental theorem in probability and statistics. It states that the probability distribution of the sum of a large number of small and mutually independent random numerical observations approaches a normal distribution as the number of observations increases. The Lindeberg condition is a condition for which the central limit theorem holds. It has been proved to be both necessary and sufficient. A Poincare type inequality is an inequality which relates the integral of the square of a function to the integral of the square of its derivative. In this report we give a new proof of the central limit theorem by using Poincare type inequalities to prove both the necessity and sufficiency of the Lindeberg condition.

FOUNDATIONS OF O-THEORY 1: THE INTERSECTION RULE
E. M. Oblow Mar. 1986 32 p
(Contract DE-AC05-84OR-21400)
(DE86-008565; ORNL/TM-9983) Avail: NTIS HC A03/MF A01

O-theory (OT) is a hybrid uncertainty theory which has been proposed for dealing with problems of uncertainty in logical inference. The foundations of one of the concepts of OT, the OT intersection operator, are explored in this paper. It is shown that a more fundamental basis for the OT rule is classical probability theory. Mass assignments in the Dempster-Shafer theory (DST) formalism are first reevaluated yielding a more basic relationship between masses and probabilities. These results are then used to show that the OT intersection rule can be derived from first principles in probability theory. A simpler axiomatic basis can then be used to establish this rule. It can, therefore, be used as alternative to Bayes' theorem for combining probabilistic belief consistently. Dempsters' rule will be shown to be a special case of the OT result. It too will be derived from probability theory axioms.

METHODS FOR THE DETECTION AND ESTIMATION OF MULTIPHASE REGRESSION MODELS Ph.D. Thesis [METHODES APPLIQUEES DE DETECTION ET D'ESTIMATION DE RUPTURE DANS DES MODELES DE REGRESSION]
Yacine Saidi 1986 108 p In FRENCH
(ESA-86-97282) Avail: NTIS HC A06/MF A01

The detection of the existance of change points and parameter identification in multiphase regressions are studied. With the help of simulations the boundary function is determined to define the sum test critical region. The empirical study of the test power is done by varying the two parameters which characterize the phase change: the location of the change point and the amplitude of the change. The test of the maximum likehood rate is then studied. It is shown by means of a simple regression model how to compute the law of the test statistics. The Hinkley estimation techniques are discussed and developed. A case study is presented to show the application of both methods. The example analyzes the multiphase correlation between depth and flow of a river. ESA

(NIKHEF-H/86-6; B8665342; ESA-86-98057) Avail: NTIS

HC A02/MF A01

An ansatz for the Beta function of SU(3) lattice gauge theory in 4 dimensions whose parameters are determined by Monte Carlo data is used to compare different sets of data for Delta Beta and to study systematic errors. The data for Delta Beta obtained from different values of the block spin renormalization group scaling factor are shown to be compatible within statistical errors. However the data is easily consistent with sizeable deviations (30% or more) from the two loop approximation to the renormalization group scaling formula for physical quantities in the region of coupling for which Delta Beta essentially takes on its asymptotic value. HAMILTON-JACOBI EQUATIONS IN INFINITE DIMENSIONS, PART 3 Summary Report
Michael G. Crandall and Pierre-Louis Lions Feb. 1986 47 p
(Contract DAAG29-80-C-0041)
(AD-A167521; MRC-TSR-2907) Avail: NTIS HC A03/MF A01 CSCL 20/4

This paper is concerned with a number of topics in the theory of viscosity solutions of Hamilton Jacobi equations in infinite dimensional spaces. The development of the theory in the generality in which the space or state variable lies in an infinite dimensional space is partly motivated by the hope of eventual applications to the theory of control of partial differential equations or control under partial observation. Among the results presented are: The existence and uniqueness theory previously discussed in spaces with the Radon Nikodym property is extended beyond this class; examples are given which show that Galerkin approximation arguments in their naive forms cannot be made the basis of an existence theory; some equations with unbounded terms of the sort that arise in control of pde's are treated by means of a change of variables reducing the problem to the previously studied cases. GRA

THE HAMILTON-JACOBI-BELLMAN EQUATION WITH A GRADIENT CONSTRAINT Summary Report
Naoki Yamada Mar. 1986 24 p
(Contract DAAG29-80-C-0041)
(AD-A167532; MRC-TSR-2927) Avail: NTIS HC A02/MF A01 CSCL 12/1

As the first order Hamilton Jacobi equation is related to a control problem associated with ordinary differential equations, the Hamilton Jacobi Bellman (HJB) equation arises from a control problem with random noise. In the stationary problem, the HJB equation has the form sup when alpha is an element of A of (L(sup alpha)u - f(sup alpha)) = 0 where L superscript alpha are second order linear elliptic operators with parameter alpha an element of A. In this paper, we are concerned with the HJB equation of the form max(L(sup 1)u - f(sup 1),...,L(sup m) -f(sup m), the absolute value of Du - g) = 0. We prove the existence of solutions which satisfy the equation almost everywhere. Using the notion of weak solution (so called viscosity solution) we prove the uniqueness of the solution in the class of continuously differentiable functions. The method of the uniqueness proof is also applicable to other obstacle problems. We prove uniqueness results in the class of continuous functions for two model problems. GRA

MAPPINGS WITH CLOSED RANGE AND FINITE DIMENSIONAL LINEAR SPACES
S. O. Iyahen Sep. 1984 17 p
(DE85-703172; IC-84/167) Avail: NTIS (US Sales Only) HC A02/MF A01

This paper looks at two settings, each of continuous linear mappings of linear topological spaces. In one setting, the domain space is fixed while the range space varies over a class of linear topological spaces. In the second setting, the range space is fixed while the domain space similarly varies. The interest is in the requirement that the mappings have a closed range implies that the domain or range space is finite dimensional. Positive results are obtained for metrizable spaces. DOE

AN INTERATIVE APPROXIMATION METHOD FOR THE CALCULATION OF THE BALANCE DISTRIBUTION FOR A FINITE MARKOV CHAIN Thesis [EEN ITERATIEVE BENADERINGSMETHODE VOOR DE BEREKENING VAN DE EVENWICHTSVERDELING BIJ EEN EINDIGE MARKOV-KETEN]
M. F. L. vanNielen Nov. 1984 82 p In DUTCH
(ESA-86-97303) Avail: NTIS HC A05/MF A01

Two iteration methods to approximate the balance distribution of irreducible aperiodic Markov chains with a successive approximation technique were developed. The balance distribution is important for the solution of problems concerning communication and computer networks. The advantage of the pre-Jacobi and Gauss-Seifdel iteration methods is the possibility to calculate lower and upper limits of the balance distribution. The techniques were numericaly tested with queueing problems. The Gauss-Seidel method is faster for the calculation of converging limits than the pre-Jacobi or vector iteration method. ESA

CHIMERA: A GRID-EMBEDDING TECHNIQUE Final Report, 1 Nov. 1980 - 1 Oct. 1985
J. A. Benek (Calspan Advanced Technology Center, Buffalo, N.Y.), J. L. Steger, F. C. Dougherty, and P. G. Buning Apr. 1986 112 p Prepared in cooperation with AEDC
(NASA-TM-89246; NAS 1.15:89246; AD-A167466; AEDC-TR-85-64) Avail: NTIS HC A06/MF A01 CSCL 09/2

A three-dimensional chimera grid-embedding technique is described. The technique simplifies the construction of computational grids about complex geometries. The method subdivides the physical domain into regions which can accommodate easily generated grids. Communication among the grids is accomplished by interpolation of the dependent variables at grid boundaries. The procedures for constructing the composite mesh and the associated data structures are described. The method is demonstrated by solution of the Euler equations for transonic flow about three ellipsoid bodies in close proximity, a wing/body, and a wing/body/tail. GRA

STEADY-STATE PROBLEMS OF NONLINEAR ELECTRO-MAGNETO-THERMO-ELASTICITY Technical Summary Report
Robert C. Rogers and Stuart S. Antman Jan. 1986 70 p
(Contract DAAG29-80-C-0041; Grants NSF DMS-85-03317; NSF dMS-82-10950)
(AD-A167454; MRC-TSR-2903) Avail: NTIS HC A04/MF A01 CSCL 20/11

This paper studies the steady-state behavior of solids that can sustain mechanical, electromagnetic, and thermal effects. The authors examine a class of boundary-value problems for a quasilinear system of functional differential equations that is derived from a very general model for such materials. They propose a physically reasonable constitutive theory which leaves this system amenable to modern methods of partial differential equations. The principal assumption is a modified version of the strong ellipticity condition. Part I proves existence results for the general system under some special physical assumptions (rigidity and hyperelasticity). The formulation admits non-local interactions caused by the magnetic self-field generated by the deformed, conducting body. Part II shows the existence and regularity of solutions of a system of functional ordinary differential equations arising from a semi-inverse problem in a more comprehensive physical situation. Author (GRA)

ON L SUB 1-CONTRACTION FOR SYSTEMS OF CONSERVATION LAWS Technical Summary Report
Jorge G. S. Patino Feb. 1986 11 p
(Contract DAAG29-80-C-0041)
(AD-A167484; MRC-TSR-2917) Avail: NTIS HC A02/MF A01 CSCL 12/1

The Cauchy problem for a 2 x 2 system of conservation laws in one dimension is u sub t + (f(u)) sub x = 0, x epsilon R, t greater than 0 u(x,0) = u sub 0 where u = (u sub 1, u sub 2), f = (f1 (u), f sub (u)). Such systems of equations usually come from the application of the laws of conservation for physical quantities like mass, momentum and energy, and arise in problems of gas dynamics, elasticity, oil reservoir simulation and other areas of engineering. The questions of decay and continuous dependence with respect to the initial data are central issues in the study of the problem above. The result proved here rules out the use of certain functionals to study the decay of solutions and is relevant to the issue of L sub 1 continuity with respect to the data. GRA

EFFECT OF TRIANGULAR ELEMENT ORIENTATION ON FINITE ELEMENT SOLUTIONS OF THE HELMHOLTZ EQUATION
Kenneth J. Baumeister 1986 23 p Proposed for presentation at the 1986 Winter Annual Meeting of the American Society of Mechanical Engineers, Anaheim, Calif., 7-12 Dec. 1986
(NASA-TM-87351; E-2734; NAS 1.15:87351) Avail: NTIS HC A02/MF A01 CSCL 20A

The Galerkin finite element solutions for the scalar homogeneous Helmholtz equation are presented for no reflection, hard wall, and potential relief exit terminations with a variety of triangular element orientations. For this group of problems, the correlation between the accuracy of the solution and the orientation of the linear triangle is examined. Nonsymmetric element patterns are found to give generally poor results in the model problems investigated, particularly for cases where standing waves exist. For a fixed number of vertical elements, the results showed that symmetric element patterns give much better agreement with corresponding exact analytical results. In laminated wave guide application, the symmetric pyramid pattern is convenient to use and is shown to give excellent results. Author

SOUND PROPAGATION OVER UNEVEN GROUND AND IRREGULAR TOPOGRAPHY Semiannual Status Report
Allan D. Pierce, Geoffrey L. Main, James A. Kearns, Daniel R. Benator, and James R. Parish, Jr. Feb. 1986 58 p
(Grant NAG1-566)
(NASA-CR-179673; NAS 1.26:179673) Avail: NTIS HC A04/MF A01 CSCL 20A

The development of theoretical, computational, and experimental techniques for predicting the effects of irregular topography on long range sound propagation in the atmosphere is discussed. Irregular topography here is understood to imply a ground surface that (1) is not idealizable as being perfectly flat or (2) that is not idealizable as having a constant specific acoustic impedance. The study focuses on circumstances where the propagation is similar to what might be expected for noise from low-altitude air vehicles flying over suburban or rural terrain, such that rays from the source arrive at angles close to grazing incidence. MEASUREMENT AND EXTRACTION OF RECURRING WAVEFORMS: FOR APPLICATIONS TO ACTIVE TRANSMISSIONS, FLOW-NOISE, AND HELICOPTER-RADIATED NOISE PROBLEMS
Roger F. Dwyer 24 Mar. 1986 39 p
(AD-A167400; NUSC-TM-861043) Avail: NTIS HC A03/MF A01 CSCL 20/1

Physical acoustic sources that radiate transient waveforms represent a large class of noise generators. Active transmissions, flow-noise, and helicopter-radiated noise under certain flight situations depending on the source-observer orientation are members of this class. The objective of this paper is to present a signal processing methodology to extract time domain recurring waveforms from data. The recurring waveforms, on the one hand, may represent a source of interference that is to be eliminated as much as possible. But, on the other hand, these recurring waveforms may represent a desired signal that is to be extracted from a background of undesired noise. Both cases are shown in the paper to be different aspects of the same problem. Initially, the methodology is based on a physical property of equally spaced and identical recurring waveforms. These results are then generalized, because in practice, either by design or by other causes, the recurring waveforms may not be equally spaced and identical. The method is then applied to extract equally spaced and nearly identical waveforms which were produced by an approaching helicopter. Author (GRA)

VERTICAL DIRECTIONALITY OF AMBIENT NOISE: 150-300 Hz
W. S. Hodgkiss and F. H. Fisher 7 Feb. 1986 74 p
(Contract N00014-84-K-0097)
(AD-A167421; MPL-TM-381; MPL-U-7/86) Avail: NTIS HC A04/MF A01 CSCL 17/1

Measurements of the vertical directionality of ambient noise in the 150-300 Hz region have been reported. The 48 element NORDA VEKA array cut for 300 Hz and centered on the sound axis (750 m) was used to collect the data. Three features of the data are striking: (1) short term stability and long term fluctuations of the vertical structure, (2) asymmetry in the levels observed by the upward and downward looking beams, and (3) the existence of an underlying boxcar characteristic to the vertical structure on top of which are substantial fluctuations often taking the form of horns at + or - 10-14 degrees with a significant notch in the + or - 9-10 degrees region. ON THE STATISTICAL EVALUATION OF INCONSISTENT MEASUREMENT RESULTS ILLUSTRATED ON THE EXAMPLE OF THE Sr 90 HALF LIFE
Willem L. Zijp Dec. 1985 29 p
(ECN-179; B8660552; ESA-86-97735) Avail: NTIS HC A03/MF A01

Evaluation of inconsistent numerical observations made by different authors or laboratories on the same physical quantity is treated. It is argued that the weighted mean based on conventional

weighting is heavily influenced by the value of the extremely small standard deviation stated by the experimenter. The method of Gray (1985) based on adjustment of relative information gives a value close to the unweighted mean, and a standard deviation which is smaller than for the unweighted case. The approach of limitation of statistical weights gives smaller values. The extended variance weighting and its improvement in the form of iterative weighting give results close to the results for the unweighted mean. ESA

HIGH STATISTICS INCLUSIVE PHI MESON PRODUCTION AT SP3 ENERGIES
H. Dijkstra, R. Bailey (Science Research Council, Chilton (England).), E. Belau (Max-Planck-Inst. fuer Physik und Astrophysik, Munich (West Germany).), T. Roehringer (European Organization for Nuclear Research, Geneva (Switzerland).), M. Bosman, V. Chabaud, C. Damerell (Science Research Council, Chilton (England).), C. Daum, G. deRijk, S. Gill et al 1986 26 p Submitted for publication
(NIKHEF-H/86-1; B8665339; ESA-86-98054) Avail: NTIS HC A03/MF A01

Inclusive phi meson production was measured for 100 GeV/c and 200 GeV/c incident pi(-) pbar and K (-), and for 120 GeV/c and 200 GeV/c incident pi (+), p and K (+), using a Be target. A total of 630,000 phi mesons were recorded in the kinematic range 0 less than x sub F less than 0.4. The differential cross sections d sigma/dx sub F and d sigma/dp sub T sq are presented. The longitudinal momentum distributions show that the strange valence quarks of the incident K mesons play an important role in phi meson production even at small sub f. The decay angular distribution of the phi meson is evaluated in the Gottfried-Jackson frame and is expressed in the elements of the density matrix. There is a small but significant cos sq theta Gottfried-Jackson dependence for small p sub T, which decreases for increasing P sub T. ESA

INCLUSIVE PHI MESON PRODUCTION, THE PARTON FUSION MODEL AND STRANGE QUARK STRUCTURE FUNCTIONS
H. Dijkstra, R. Bailey (Science Research Council, Chilton (England).), E. Belau (Max-Planck-Inst. fuer Physik und Astrophysik, Munich (West Germany).), T. Bohringer (European Organization for Nuclear Research, Geneva (Switzerland).), M. Bosman, V. Chabaud, C. Damerell (Science Research Council, Chilton (England).), C. Daum, G. deRijk, S. Gill et al 1986 14 p Submitted for publication
(NIKHEF-H/86-3; B8665340; ESA-86-98055) Avail: NTIS HC A02/MF A01

The parton fusion model is used to describe the longitudinal differential cross section of hadronic phi production. The cross section for phi production in pi (+or-) p, p (-) p, and K (+or-) p interactions is evaluated in the model by using structure functions for the constituents of the interacting particles. A comparison between the model and high statistics data in the Feynman x range 0 less than x sub F (phi) less than 0.4 allows the determination of the strange valence quark distribution in pi mesons, which appears to be harder than the light sea quark distribution. The comparison also shows that a significant part of inclusive phi production is due to the OZI allowed fusion of strange quarks, while the OZI inhibited fusion diagrams are strongly suppressed. ESA

HADRONIC PHI PRODUCTION AND THE LUND MODEL FOR LOW p SUB T INTERACTIONS
H. Dijkstra, R. Bailey, E. Belau, T. Boehringer, M. Bosman, V. Chabaud, C. Damerell, C. Daum, G. deRijk, S. Gill et al 1986 9 p Submitted for publication
(NIKHEF-H/86-4; B8665341; ESA-86-98056) Avail: NTIS HC A09/MF A01

Experimental results on inclusive phi production are compared with the Lund model for low p sub T hadronic interactions. The data is based on a sample of 600,000 phi mesons in the kinematic range p sub T less than 1.0 (GeV/c) sq and 0.0 less than x sub F less than 0.4, produced in pi (+or-), k (+or-) p and p Be interactions at 100 GeV/c and 120 GeV/c incident momentum. The Lund model reproduces the shapes of the longitudinal differential cross sections reasonably well, but the relative cross sections for incident pi, K and p show a discrepancy with the data. ESA

DEUTERON PROPERTIES STUDIED IN NEUTRINO AND ANTINEUTRINO INTERACTIONS
A. G. Tenner 1986 32 p
(NIKHER-H/86-7; B8664354; ESA-86-98058) Avail: NTIS HC A03/MF A01

Interactions of neutrinos and antineutrinos were studied in a deuterium bubble chamber. The spectrum of proton spectators was studied and compared with the predictions of different deuterium models. Rescattering was investigated. The spectrum of spectator protons may be explained from current deuteron models. To obtain agreement between the theory and the data, kinematical effects of the neutrino interactions have to be included. The results then show evidence for a diffractive component in deuteron rescattering. The slow protons produced in nu root nu/deuteron interactions can be separated into prompt protons, rescattering protons, and spectators. There is quantitative agreement with the predictions. No other sources of protons need to be considered. Results partly agree with the additive quark model of rescattering. No evidence is found for the excitation of a Delta (1236) resonance through pi (+) p rescattering. No evidence is found for the existence of a Delta-Delta structure of the deuteron. No evidence is found for deuterons in the final state of nu root nu deuteron interactions. ESA

A STUDY OF THE INTERACTIONS OF HIGH ENERGY ELECTRON-NEUTRINOS Ph.D. Thesis
Cornelis Hermanus Maria Nieuwenhuis 1986 100 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie
(ESA-86-98072) Avail: NTIS HC A05/MF A01

Data on electron-neutrino and antineutrino interactions with nuclei were collected with a calorimeter in a beam dump exposure to 400 GeV/c protons, to verify if the ratio of the flux of prompt electron-neutrinos and muon-neutrinos may deviate from unity. The cross-section ratio for NC/CC interactions of nue + nu bar e, Re = 0.40 +or- 0.12 (+or- 0.08 syst) is found in agreement with the known cross-section ratio R mu = 0.330 +or- 0.01 for nu mu + nu bar mu. This equality is predicted by the Standard Model of electroweak interactions. The prompt CC (nu (nu bar) e)/CC (nu (nu bar) mu) flux ratio is not in bad disagreement (1.8 standard deviations) with the Standard Model predictions under assumption of equal fluxes for nu e and nu bar e. The energy dependence of the prompt electron-neutrino flux agrees with a Monte Carlo prediction simulating DD bar production and semileptonic decay. The calculated DD bar cross-section times semileptonic branching ratio agrees with the results of other measurements of this quantity. ESA

(AD-A167762; VLSI-MEMO-85-275) Avail: NTIS HC A02/MF A01 CSCL 20/7

The finely focused ion beam is a new instrument with many uses. It can focus a beam of any one of many species of ions at energies up to 200 kV to dimensions below 0.1 micrometers. This capability can be used: to implant dopants in semiconductors in a maskless process, to mill away material and repair masks or circuits, to deposit material with submicron resolution if an appropriate local gas ambient is present, to perform lithography by exposing resist, and to analyze and examine specimens. There are about 30 sophisticated systems in operation world wide, about two thirds of them in Japan. The field is still in its infancy, and one can expect both improvements in machinery and many new applications to develop particularly in the area of custom semiconductor devices. GRA

CARBON MONOXIDE FORMATION IN UO2 KERNELED HTR FUEL PARTICLES CONTAINING OXYGEN GETTERS
Emil Proksch, Anton Strigl, and Heinz Nabielek Jan. 1986 25 p Submitted for publication
(OEFZS-4348; CH-358/86; ESA-86-97248) Avail: NTIS HC A02/MF A01

Mass spectrometric measurements of CO in irradiated UO2 fuel particles containing oxygen getters are summarized. Uranium carbide addition in the 3% to 15% range reduces the CO release by factors between 25 and 80, up to burn-up levels as high as 70% FIMA. Unintentional gettering by SiC in TRISO coated particles with failed inner pyrocarbon layers results in CO reduction factors between 15 and 110. For ZrC, ambiguous results are obtained; ZrC probably results in CO reduction by a factor of 40; Ce2O3 and La2O3 seem less effective than the carbides; for Ce2O3, reduction factors between 3 and 15 are found. However, the results are possibly incorrect due to premature oxidation of the getter already during fabrication. Addition of SiO2 + Al2O3 has no influence on CO release. ESA

PETROPHYSICAL QUANTITIES FROM HIGH RESOLUTION GAMMA-RAY SPECTRA ARISING FROM ENERGETIC NEUTRON BOMBARDMENT
D. W. Mellor and M. C. Underwood 1985 27 p Presented at the 26th Annual Logging Symposium, Dallas, Tex., 17-20 Jun. 1985
(ESA-86-97256) Avail: NTIS HC A03/MF A01

A logging tool comprising a 5 Curie Am241-Be neutron source and n-type intrinsic germanium gamma ray detector was developed. A large calibration tank, in simulated well-bore geometry, comprising oil and water saturated sand, was constructed and was interrogated using the tool. In a separate experiment, oil zone material was irradiated using 14 MeV neutrons. An interpretational model that allows the porosity, oil and water saturation, matrix composition, and water salinity to be inferred is presented. This confirms that under strictly controlled experimental conditions, major petrophysical properties can be inferred from high resolution gamma ray spectra. ESA

INTEGRAL-DATA TEST OF JEF-1 FISSION-PRODUCT CROSS SECTIONS
A. J. Janssen, H. Gruppelaar, R. J. Heijboer, N. Karouby-Cohen, L. Martin-Deidier, G. Rimpault, and M. Salvatores Nov. 1985 145 p
(ECN-176; B8577863; ESA-86-97734) Avail: NTIS HC A07/MF A01

Integral data from STEK (5 cores), CFRMF, ZONA-1, RONA-3, and PHENIX were used to test the fast-capture fission product cross section evaluations of 60 materials. Experimental and calculated capture reactivity values in the five STEK cores for most of these nuclides are given. A correction for scattering based upon the original evaluation was made. There are indications that this correction is too small for even-mass isotopes due to the neglect of direct-collective effects in the inelastic scattering evaluations. This also follows from comparison with activation and irradiation measurements performed in CFRMF, ZONA-1, RONA-3, and PHENIX. A survey of all the results, expressed by the ratio of experimental to calculated values as a function of the relative response above 1 keV in the various assemblies, is presented. ESA

N86-32264# Netherlands Energy Research Foundation, Petten.
ON THE GLOBAL BEHAVIOR OF A CYLINDRICAL SALT DOME WITH A HLW REPOSITORY
J. Prij and J. Klok Dec. 1985 52 p
(ECN-180; B8660553; ESA-86-97736) Avail: NTIS HC A04/MF A01

The influence of the thermomechanical properties of the rock salt and the surrounding rocks on the thermal stresses and surface rise is discussed, based on finite element creep analyses of a homogeneous cylindrical salt dome. The parameters are constants in the thermomechanical constitutive behavior of salt and rocks and increase the thermal loading. It is shown that variations in the creep properties, which result in differences in creep strain rate of a factor 100, have only a very limited influence on the

thermal stresses and surface rise. More important is the elastic stiffness of the materials. In all creep analyses thermal stresses in the salt are compressive, and shear stresses reach values < 2 MPa. It is concluded that thermal stresses do not influence the isolation capability of homogeneous salt dome negatively. ESA

OPTICAL DISTANCE MEASURING INSTRUMENT
James B. Abshire, inventor (to NASA) 15 Jul. 1986 10 p Filed 10 Aug. 1982 Supersedes N83-13982 (21 - 04, p 600)
(NASA-Case-GSC-12761-1; US-Patent-4,600,299; US-Patent-Appl-SN-406820; US-Patent-Class-356-5; US-Patent-Class-356-4.5) Avail: US Patent and Trademark Office CSCL 20F

An optical instrument, such as a stability monitor or a target range finder, uses an unstabilized laser to project a composite optical signal of coherent light having two naturally occurring longitudinal mode components. A beamsplitter divides the signal into a reference beam which is directed toward one photodetector and a transmitted beam which illuminates and is reflected from a distant target onto a second photodetector optically isolated from the first photodetector. Both photodetectors are operated on the square law principle to provide electrical signals modulated at a frequency equal to the separation between the frequencies of the two longitudinal mode components of the optical signal projected by the laser. Slight movement of the target may be detected and measured by electrically monitoring the phase difference between the two signals provided by the photodetectors and the range of the target measured with the aid of a microprocessor by changing the separation between the longitudinal modes by shifting the length of the resonator cavity in an iterative series of increments. DIRECT MEASUREMENT OF THE NONLINEAR PHASE SHIFT BETWEEN THE ORTHOGONALLY POLARIZED STATES OF A SINGLE-MODE FIBER
Bruno Crosignani, Salvatore Piazzolla, Paolo Spano, and Paolo DiPorto Sep. 1984 5 p
(FUB-36-1984; ESA-86-97882) Copyright. Avail: Issuing Activity

The noise associated with the optical Kerr effect, which is a frequent cause of frequency broadening and pulse reshaping was studied. The light from a continuous wave linearly polarized argon laser was coupled to a polarization maintaining birefringent fiber. The excitation conditions are such as to provide single mode operation. The 2 polarization states have a power ratio of 25 to 1. The nonlinear effect is observed through the beat signal between the two orthogonal fields. The mathematical analysis shows that the model equation contains a nonlinear term following the time fluctuations of the polarization power in the first state. For a long fiber it can become relevant even at low power. The noise described is analogous to the phase noise generated in angle modulated fiber communication systems by power fluctuations of the source. ESA

(AD-A166319; UBUFFALO/DC/86/TR-7) Avail: NTIS HC A02/MF A01 CSCL 20/6

The conditions under which the Rayleigh hypothesis is exact and the convergence properties of the Rayleigh expansion are considered. The identification of the cause of the deficiency of this expansion suggests an alternative dressed expansion with presumably simpler convergence properties. This proposition is checked for a sinusoidal grating (SG), for which convergence is found for an arbitrary value of beta = (2pi) g/d, where g and d denote the height and periodicity of the SG, respectively. The dressed expansion is used to analyze the surface plasmon dispersion and local field enhancement distribution pertaining to the SG in the limit as beta goes to infinity. The dispersion relation is comprised of two bands. The local field enhancement predicts stronger fields at the bottoms of the troughs than at the peaks of the SG. GRA

(AD-D012207; US-Patent-4,569,033; US-Patent-Appl-SN-504331; US-Patent-Class-364-845) Avail: US Patent and Trademark Office CSCL 20/6

An optical matrix multiplier using two linear modulating arrays in which the columns of the first matrix to be multiplied control the modulation of one array and the rows of the second matrix control the other array. Light is directed through all combinations of elements on the two arrays and the resultant beams measured by individual elements of a two-dimensional detector array. The detecting elements integrate the intensity of light falling on each of them, which value corresponds to an element of the product of the two matrices. The invention may be implemented among other ways with two linear electrooptical arrays, a linear array of light emitting diodes and a linear electrooptical array, or two Bragg cells and a pulsed light source. ON THE STABILITY OF THE PROBLEM OF TARGET TRACKING WITH THE FLIR Final Report, 1984 - 1985
David S. Anker Jan. 1986 5 p
(AD-A167721) Avail: NTIS HC A02/MF A01 CSCL 17/5

This document considers stochastic differential equations of Ito type. This problem is a fundamental one in the field of stochastic control. The theory of stochastic control has been successfully applied to a wide variety of practical problems as demonstrated in Maybeck, including problems involving the tracking of objects with imaging sensors. The problem of tracking aircraft with infrared sensors has been addressed in this mathematical framework by Kendrick, Maybeck, and Reid and by Maybeck, Jensen, and Harnley. The specific problem which gave impetus to this research involves real time control of the orientation of the optical axis of an infrared imaging sensor. The problem of choosing a good control for a system modeled in this framework involves the property of stability of solutions of the stochastic differential equation representing the system. Stability of these solutions is established by constructing a Liapunov function for the equation. In this way, the construction of a Liapuinov function for the equation is of great value in choosing controls. This and other background material are explained in Kushner. In his recent monograph, Mees remarked that there is no good general method for constructing Liapunov functions for systems represented by ordinary differential equations. GRA

A PORTABLE SUBJECT CONTROLLED NIGHT VISION ADAPTOMETER
John L. Kobrick, Calvin Witt, and Jose Miletti Nov. 1985 15 p
(AD-A167848; USARIEM-T-1/86) Avail: NTIS HC A02/MF A01 CSCL 06/16

This report describes a new adaptometer which was designed at this Institute for assessing night vision parameters of the military population at field sites, and to quantify the effects of extended exposure to high altitude. The instrument is based on a previously developed concept of dark adaptation measurement in which the subject continually adjusts the threshold luminance of a recurrently flashing stimulus. This device, however, represents a modernized version of the technique which employs computerized data translation. It also offers the advantages of rugged construction and field portability. The instrument has functioned reliably in field conditions, and has generated valid dark adaptation functions on soldier test subjects in use at the USARIEM High Altitude Test Facility, Pikes Peak, Colorado. REAL TIME MATH MODEL FOR INFRARED Final Technical Report, Jun. 1983 - Sep. 1985
David R. Hertling and R. C. Rearick Jan. 1986 59 p
(Contract F30602-81-C-0185)
(AD-A168133; GIT/E4857A-85; RADC-TR-85-247) Avail: NTIS HC A04/MF A01 CSCL 17/5

The main objective of this work was to access the feasibility of developing a real time math model which could be used to process infrared imagery with current real-time stereo compilation equipment. A survey of existing infrared sensors, imaging sensors, photogrammetric techniques and procedures for stereo viewing and plotting are pesented. A flexible system model was developed which can be adapted to various types of infrared imaging systems. Investigations revealed that the photogrammetric techniques accurate enough for mapping and targeting applications require accurate flight dynamics data which must be simultaneously recorded with the imagery. It is theoretically possible to process certain images which contain known or analytically solvable ground information; however, such procedures would depend upon the image itself and would not be amenable to evolving into a generalized math model. OPTICAL CHARACTERIZATION OF NONLINEAR CRYSTALS
L. G. DeShazer and C. S. Hoefer Aug. 1985 18 p
(Contract W-7405-eng-48)
(DE86-006694; UCRL-15707-Pt-2) Avail: NTIS HC A02/MF A01

The final report on Optical Characterization of Nonlinear Crystals recorded the measurements of refractive indices and their thermal variations for thirteen nonlinear crystals isomorphic to KDP. This report is an Addendum to that report correcting some values reported for three crystals (AD*P, RD*P, KDA) and adding new data for three others (ADP, KDP, KD*P). The discrepancies in the final report resulted from crystals having either improper composition (AD*P) or wrong crystallographic orientation (RD*P, KDA). Six additional crystal prisms and slabs supplied by Interactive Radiation Inc. were used to obtain the corrected data reported here. Also, two crystals not measured before (RD*A, KDP:Rb) were measured and are described in this addendum. DOE

(Contract W-7405-eng-48)
(DE86-009691; UCRL-15792) Avail: NTIS HC A02/MF A01

The diffusion-driven detector uses gratings from crossed optical beams and diffusion to produce a very fast photodetector. Analysis of this instrument has been extended to the high level injection regime, indicating that the observed impulse response will be a single exponential rather than a double exponential. Also reported are laboratory renovations, in particular the installation of a cw mode-locked YAG laser and a sync-pumped dye laser. DOE

EXTREME ULTRAVIOLET MULTILAYER REFLECTORS
M. L. Scott, P. N. Arendt, B. J. Cameron, B. E. Newman, D. Windt, and W. Cash 1986 10 p Presented at the Topical Meeting on Short Wavelength Coherent Radiation, Monterey, Calif., 24 Mar. 1986 Prepared in cooperation with Colorado Univ., Boulder
(Contract W-7405-eng-36)
(DE86-010194; LA-UR-86-1378; CONF-860316-5) Avail: NTIS HC A02/MF A01

We have investigated the design, fabrication, and reflectance measurements of a multilayer silver/silicon reflector for use at 58.4 nm. Our results indicate that reflectors in the extreme ultraviolet do not perform as well as predicted due to the presence of surface oxides and other surface contamination layers. In addition, we have found that the correct optical constants for silver have now been published. We find also that these multilayer coatings can be utilized as reflective polarizers in the EUV with an extinction ratio of 75:1 and a throughput of 28% for the s-polarized component of the beam. STUDY OF OPTICAL COMPUTING
Vojin Plavsic Mar. 1986 43 p In SWEDISH; ENGLISH summary
(FOA-C-30416-E1; ISSN-0347-3708; ESA-86-97863) Avail: NTIS HC A03/MF A01; Research Inst. of National Defence, Stockholm, Sweden KR. 50

The capabilities of optics to complement or replace electronics in the implementation of digital data processing is investigated. The inherent features of optics such as: multiple 2-D (parallel) broad band channels, higher switching speed, simplicity and flexibility in interconnection of arbitrary complex digital optical circuits, and power consumption are described. Practical results are rather modest; one explanation of this situation is the lack of clear architectural concepts for utilizing the benefits of optics. ESA

FRONTIERS OF THE PLASMASPHERE (THEORETICAL AS-

PECTS) Thesis
J. Lemaire 1985 283 p
(Aeronomica-Acta-A-298-1985; ESA-86-97483) Avail: Issuing Activity

The formation of the light ion trough, i.e., the depression of the ion densities H(+) and He(+), observed in the midlatitude ionosphere, is explained by two different mechanisms. The variations of the equatorial density of the total content and of the temperatures inside a plasma element are derived. The historical context within which experimental and theoretical understanding of the plasmasphere and of its equatorial limit the plasmapause developed since 1963 is described. ESA

Temperature and density analysis in the Automated Analysis Program (for the global empirical model) were modified to use flow velocities produced by the flow velocity analysis. Revisions were started to construct an interactive version of the technique for temperature and density analysis used in the automated analysis program. A sutdy of ion and electron heating at high altitudes in the outer plasmasphere was initiated. Also the analysis of the electron gun experiments on SCATHA were extended to include eclipse operations in order to test a hypothesis that there are interactions between the 50 to 100 eV beam and spacecraft generated photoelectrons. The MASSCOMP software to be used in taking and displaying data in the two-ion plasma experiment was tested and is now working satisfactorily. Papers published during the report period are listed. STATIONARY, ONE-DIMENSIONAL MODELS FOR LASER-PRODUCED PLASMAS [STATIONAERE, EINDIMENSIONALE MODELLE FUER LASERERZEUGTE PLASMEN]
K. Daree 18 Jun. 1985 134 p In GERMAN
(ISL-R-107/85; ESA-86-97623) Avail: NTIS HC A07/MF A01

One-dimensional, stationary models for laser-produced plasmas were compared. The most interesting models seem to be those with the assumption of a self regulation of the plasma, i.e., based on the defined geometrical dimensions of the plasma. Such a model was numerically evaluated for a parallel flow, whereby the physical effects partial ionization, laser light absorption, and heat conduction were taken into account. The effect of several parameters (e.g., laser beam intensity, laser wavelength) on the calculation results is discussed. The calculation results agree very satisfactorily with experimental results. ESA

THE DEVELOPMENT OF A MAGNETOOPTIC CURRENT MEASUREMENT SYSTEM FOR HIGH, PULSED CURRENTS
H. S. Lassing Dec. 1985 49 p Sponsored by Euratom, Nederlandse Organisatie voor Zuiver-Wetenschappelijk Onderzoek and Stichting voor de Technische Wetenschappen
(Rept-85-161; ESA-86-98045) Avail: NTIS HC A03/MF A01

A current-measurement system based on the Faraday rotation in a single-mode fiber for a screw pinch experiment is described. It is shown that an ultra low birefringence spun single-mode fiber is extremely suitable for use in a magneto-optic current-meter. The properties of this fiber were investigated. Measurements of high, pulsed currents (Imax = 1 MA: f = 25 kHz) with good accuracy and in accord with theory are presented. In order to calculate the current unambiguously and more accurately from the signals of the current-meter, a system with a double detector (to measure sin2 phi and cos2 phi simultaneously) was constructed. Measurements of high, pulsed currents with this system are also presented. It is concluded that a beam splitter prism is not the correct instrument for double detector measurements. A 50% transparant mirror and a double lens are suggested. ESA

ION TEMPERATURE IN TORTUR 3
F. B. Hendriks and H. J. B. M. Brocken Dec. 1985 36 p Sponsored by Euratom and Nederlandse Organisatie voor Zuiver-Wetenschappelijk Onderzoek
(Rept-85-162; ESA-86-98046) Avail: NTIS HC A03/MF A01

Spatially resolved ion-energy distributions for discharges in the TORTUR 3 tokamak are presented. The measurements were performed in an active method, using a neutral hydrogen probing beam of 20 to 30 keV, to enhance charge-exchange processes along its path, as well as by the usual passive method. Ion temperatures can amount to 1 keV. ESA

N86-32296# FOM-Inst. voor Plasmafysica, Rijnhuizen, Jutphaas (Netherlands).
OPTIMIZATION STUDY FOR ION TEMPERATURE MEASUREMENTS BY MEANS OF RUTHERFORD SCATTERING
A. J. H. Donne and E. P. Barbian Mar. 1986 41 p Sponsored by Euratom and Nederlandse Organisatie voor Zuiver-Wetenschappelijk Onderzoek
(Rept-86-164; ESA-86-98047) Avail: NTIS HC A03/MF A01

A feasibility study to optimize the parameters when the Rutherford-scattering technique is applied to ion temperature measurement in a medium sized tokamak experiment was performed. Together with a time-of-flight analyzer with energy resolution of 100, a 20 keV helium probing beam with a neutral current density of 10 A/msq can provide a detailed spectrum within 3 msq, from which the ion temperature can be extracted with an accuracy of better than 10%. The influence of plasma impurities and resonant charge exchange on the scattering process is discussed. The good spatial resolution makes the method very suitable to investigate energy deposition profiles in ion-cyclotron radiation applied to the plasma for plasma heating. ESA

SELECTIVE ANODIC OXIDATION OF SEMICONDUCTORS FOR PATTERN GENERATION Patent
Bijan Davari and Pankaj K. Das, inventors (to Air Force) Issued 11 Feb. 1986 11 p Supersedes AD-D011889
(AD-D012245; US-Patent-4,569,728; US-Patent-Appl-SN-667306; US-Patent-Class-204-15) Avail: US Patent and Trademark Office CSCL 20/12

The present invention relates to GaAs integrated circuit technology, and in particular, to a novel means of controlling oxidation growth rate on anodically oxidized GaAs samples. This abstract discloses an apparatus and a method for selectively controlling anodic oxide growth on semiconductors for controlled electrochemical pattern generation incorporating use of a writing beam of a wavelength which encourages oxide growth and a bias beam at a wavelength which discourages oxide growth. The bias beam is projected on the semiconductor in electrolytic environment to prevent or retard oxide growth while oxide growth is accelerated at points of illumination by means of writing beam. RAMAN SPECTROMETER WITH MICROPROBE CAPABILITY Final Report, 15 Jul. 1984 - 15 Jul. 1985
J. T. Boyd and H. E. Jackson 15 Jan. 1986 13 p
(Grant AF-AFOSR-0287-84)
(AD-A167008; AFOSR-86-0156TR) Avail: NTIS HC A02/MF A01 CSCL 14/2

This report describes the results of this equipment grant funded as a part of the Department of Defense (DOD) University Research Instrumentation Program. This grant funded the purchase of a Raman spectrometer with microprobe capability having resolution of 1.0 micron. This report describes the equipment selecting decision, the configuration of the instrument selected, and some experimental results. The experimental results include Raman spectra used in characterization of laser recrystallized silicon and ion implanted regions in semi-insulating GaAs. The Raman microprobe can be used to characterize the effects of substrate temperature, beam power density and shape, beam scan speed and direction, deposition rate, substrate seeding, and polysilicon encapsulation schemes both near and away from grain boundaries. The frequency shift and the peak width of the Raman scattering from the triply degenerate zone center phonon in Si allow determination of the strain in the grains of laser recrystallized polysilicon. Reducing these strains will allow us to achieve large single grains of device quality. GRA

AN IMPROVED MODEL OF THIN FILM GROWTH M.S. Thesis
David J. Doryland Dec. 1985 133 p
(AD-A167147; AFIT/GEP/ENP/85D-2) Avail: NTIS HC A07/MF A01 CSCL 07/4

A VAX-11/785 computer was used to simulate the two dimensional growth of thin films produced by vapor deposition. In this model molecules and impurities were represented by three different sized disks. In order to simulate varying deposition conditions and evaporants, several variable parameters were introduced. Among these parameters were the variation of the deposition angle about some main angle, the mobility of the disks upon collision, the ability to introduce impurities into the microstructure, the simulation of multilayered coatings and the ability to introduce imperfections into the substrate. The results obtained by this model show that disks can be used to simulate some of the main features exhibited by vapor deposited films. Among these features are the formation of columns and their compliance with the tangent rule, and the disappearance of this structure in the case of large disk mobility. Another feature found to be exhibited in the modeled films is that under certain conditions impurities and substrate imperfections can produce large voids and/or nodules. Other characteristics found in the simulated films include pores which could allow water absorption, and increased packing

density for films produced with angle variations along with a moderate amount of disk mobility. GRA

OPTIMIZATION OF THE THERMOELECTRIC FIGURE OF MERIT OF FINE-GRAINED SEMICONDUCTOR MATERIALS BASED UPON LEAD TELLURIDE Final Technical Report, 31 Aug. 1984 - 30 Mar. 1986
D. M. Rowe Feb. 1986 41 p
(Contracts DAJA45-84-C-0029; DA Proj. 1T1-61102-BH-57)
(AD-A167647) Avail: NTIS HC A03/MF A01 CSCL 20/12

Lead telluride type semiconductors are used in the fabrication of thermoelectric modules. This report covers the programme to produce materials based upon lead telluride with improved figures of merit and hence greater thermoelectric conversion efficiency. One way of improving the figure of merit is by reducing the lattice thermal conductivity of the material. This can be achieved by increasing phonon grain boundary scattering. A realistic theoretical model has been developed for lead telluride and used to investigate the lattice thermal conductivity as a function of grain size and level of doping. In optimally doped material with a grain size of 1 micrometer, the reduction in lattice thermal conductivity was predicted to be 4-6 percent compared with equivalent single crystal. Thermal diffusivity measurements on small grained compacts supported this prediction. Phonon grain boundary scattering is enhanced in semiconductor alloys because of the presence of disorder scattering and the theoretical model was extended to take this factor into account. PbSnTe and PbGeTe were identified as alloys whose lattice thermal conductivity could be significantly decreased by a reduction in grain size and in optimally doped compacted material with a grain size of 0.5 micrometer the reduction compared to equivalent single crystal material was estimated to be 11 and 14 percent respectively. CHARACTERIZATION OF ILLUMINATED SEMICONDUCTOR/SOLID-ELECTROLYTE JUNCTIONS. SEMICONDUCTOR REDOX POLYMER DETECTOR JUNCTIONS Interim Technical Report
Sharon K. Schmidt, Ronald L. Cook, and Anthony F. Sammells 15 Sep. 1985 25 p
(Contract N00014-84-C-0723)
(AD-A167665) Avail: NTIS HC A02/MF A01 CSCL 20/12

The dependency of n-TiO2 flatband potential (V sub fb) for cells of the general configuration: n-TiO2/Nafion 117, Redox species/SnO2 conducting glass, was systematically studied for the redox species Ru(bpy)32+, Fe(bpy)32+ and Ru(NH3)63+ as a function of their concentration within the polymer. The linear relationship V sub fb = M (1/concentration) + b, was found to hold for all cells. The slope (M) was found dependent upon metal complex used and its oxidation state. The sensitivity of n-TiO2, V sub fb to its immediate chemical environment at its interface with the redox polymer can be a strategy pursued for chemical detection. GRA

SEMICONDUCTOR/SOLID ELECTROLYTE JUNCTIONS FOR OPTICAL INFORMATION STORAGE. ELECTROCHROMIC EFFECTS ON HEPTYL VIOLOGEN INCORPORATED WITHIN A SOLID POLYMER ELECTROLYTE CELL Interim Technical Report
Anthony F. Sammells and Nirupama U. Pujare 15 May 1986 17 p
(Contract N00014-84-C-0723)
(AD-A167638) Avail: NTIS HC A02/MF A01 CSCL 07/4

Solid state electrochromic cells of the configuration SnO2 Glass; poly(AMPS) + HV(2+) + NaPF6; Nafion 117; poly(AMPS) + CeC13 + NaPF6; SnO2 Glass were prepared. Upon subjecting the Heptyl Viologen (HV(2+)) working electrode compartment to a cathodic scan, two distinct reduction peaks were observed at respectively -1.74 and -1.90V versus the Cec13/SnO2 reference counter electrode. This corresponded to the formation of respectively, the radical and diradical cation species of HV(2+). This electrochromic cell was found to be highly electrochemically reversible as monitored by a He/Ne laser beam (583nm) transmitted through the bulk of this semitransparent thin film solid-state cell. Cells were also prepared using n-TiO2 as the working electrode in contact with the HV(2+) compartment. A progressive trend to more negative n-TiO2 flat band potentials (V sub FB) was observed between the initially prepared cell and the first and second electrochemically formed HV(2+) radical cation species. GRA

EXPERIMENTAL STUDY OF ELECTRONIC STATES AT METAL-DIELECTRIC INTERFACES Interim Technical Report, 2 Feb. 1983 - 31 May 1984
A. J. Sievers 23 Dec. 1985 16 p
(Grant AF-AFOSR-0121-81)
(AD-A167724; AFOSR-86-0075TR) Avail: NTIS HC A02/MF A01 CSCL 20/12

The method of attenuated total reflection has been used in the visible region to obtain precise values of the dielectric function of Ag films in contact with different dielectric media. By measuring, at eight visible laser wavelengths, the surface-plasmon resonance of an Ag film against air and then against an organic liquid, we show that for both cases the dielectric function can be described by the Drude model with the well-known frequency-dependent relaxation time. The observed change in the frequency dependent parameters appears to eliminate all previous models which have been proposed to describe this frequency dependent relaxation time. The observed changes are consistent with the idea of a complex relaxation time whose real and imaginary parts are connected in a casual way. The index-of-refraction dependence of the Drude parameters demonstrates that surface electrodynamics must play an important role. Author (GRA)

SEMICONDUCTOR/SOLID ELECTROLYTE JUNCTIONS FOR OPTICAL INFORMATION STORAGE. SOLID-STATE ELECTROCHROMIC CELL USING LUTECIUM DIPHTHALOCYANINE Interim Technical Report, 15 Sep. 1985 - 15 Jan. 1986
Anthony F. Sammells and Nirupama U. Pujare 15 Jan. 1986 13 p
(Contract N00014-84-C-0723)
(AD-A167869) Avail: NTIS HC A02/MF A01 CSCL 20/12

The overall program goal is to perform a basic investigation of photoelectrochemical and electrochemical effects by electrochromic materials in solid polymer electrolyte (SPE) containing solid-state cells. Initial investigations have been directed towards reversible electrochromic behavior at the interface between lutecium diphthalocyanine deposited onto electronically conducting glass, and the homopolymer poly-2-acrylamido -2-methylpropane sulfonic acid (poly(Amps)). We wish to report here some recent work on solid-state electrochromic cells in which ionic mediation to thin-film deposits of lutecium diphthalocyanine is via the homopolymer poly-2-acrylamido-2-methyl propane sulfonic acid (poly-Amps). Separation between the working (LuH(Pc)2 deposited onto SnO2 conducting glass) and counter (CeCl3 in poly (Amps)) electrodes in these solid-state cells was realized by the use of the insoluble copolymer perfluorosulfonic acid (Nafion). Solid-state electrochromic cells were prepared using the supporting electrolytes (SEs) 0.1M Na2SO4 and 0.1M KCl. Upon subjecting the cell to anodic and cathodic voltage scans, up to four distinct color changes were observed varying from red (at anodic potentials) to violet (at cathodic potentials). Formation of the violet lutecium diphthalocyanine reduction product was not found contingent upon the absence of alkali cations as reported by others. GRA

OPTOELECTRONIC DEVICES AND RELATED PHYSICAL PHENOMENA IN THIN FILM SEMICONDUCTOR CONFIGURATIONS Final Report
C. Lindsey, J. Salzman, K. Vahala, and Amnon Yariv 1 May 1986 28 p
(Contract N00014-76-C-0322)
(AD-A167983) Avail: NTIS HC A03/MF A01 CSCL 20/12

A research program in semiconductor lasers and related phenomena resulted in new understanding relating to coherent single lobe laser arrays and to structures displaying near-diffraction-limited output. Using our molecular beam epitaxial reactor, we have demonstrated new unstable resonator geometry of semiconductor laser which potentially are capable of producing large aperture high power without the need for arrays. Typical powers of approx. 0.4 Watt were demonstrated in a single mode. Basic theoretical analysis and experiments on noise in semiconductor lasers has resulted in a new quantum formulation which takes into account the amplitude to phase coupling. This coupling is characterized by a new dispersive parameter alpha. Direct measurement of alpha were performed. GRA

SINGLE-CRYSTAL NEUTRON DIFFRACTION STUDY OF THE DISTRIBUTION AND THERMAL MOTION OF SILVER IONS IN ALPHA- AND BETA-Ag SI
J. J. Didisheim, R. K. McMullan, and B. J. Wuensch 1985 14 p Presented at the 5th International Conference on Solid-State Ionics, Lake Tahoe, Calif., 18 Aug. 1985 Prepared in cooperation with Brookhaven National Lab., Upton, N.Y.
(Contract DE-AC02-76CH-00016)
(DE86-005056; BNL-37301; CONF-850870-5) Avail: NTIS HC A02/MF A01

Single-crystal neutron diffraction data have been used to examine the distribution of mobile Ag ions in anion-ordered -Ag Si (space group Pm3m) and anion-disordered -Ag Si (space group Im3m) at 8 temperatures in the overall range 23 to 475 C. The Ag density in the phase is confined to a cluster of four tetrahedral sites grouped at the centers of the cell faces, closely spaced as a result of the different distances between Ag and the two species of anion. The individual sites are not resolved in Fourier syntheses because of large thermal displacements within a flat potential well, but the refinements permit rejection of occupancy of the octahedral site. The Ag distribution in -Ag Si displays a 2-coordinated site on the body diagonal of the cell and density delocalized in (100) bands which display fine structure not present in -AgI or -AgS. This feature may be qualitatively interpreted as an average over positional disorder of the equilibrium position within the tetrahedral interstice, the location depending on the short-range configuration of anions about the site. Models employing partial Ag occupancy of the 2-coordinated position plus either octahedral or tetrahedral site occupancy involve the same number of structural parameters and refined to comparable levels. Tetrahedral site occupancy is judged to be somewhat more likely on the basis of agreement for the higher temperature data sets and physical criteria. DOE

MICROCRYSTALLINE GROWTH STUDIES IN MODEL OXIDE BY DYNAMIC LASER-LIGHT SCATTERING METHODS
C. H. Byers and M. T. Harris 1986 6 p Presented at the 4th Contractors' Workshop on Advanced Laser Technology for Chemical Measurements, Seattle, Wash., 29 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-007300; CONF-8604130-1) Avail: NTIS HC A02/MF A01

A state-of-the-art laser light scattering facility has been developed for determining the average size of a seed material. The homogeneous nucleation technique has been used to study tetraethoxy orthosilane (TEOS), which hydrolyzes to produce silica. The titanium analog of TEOS is also being studied. DOE

UNIFORMLY-DOPED Cr, Nd:GGG CRYSTALS Final Report, 1 Jan. 1985 - 31 Dec. 1985
E. W. ODell 11 Apr. 1986 21 p
(Contract W-7405-eng-48)
(DE86-009692; UCRL-15784) Avail: NTIS HC A02/MF A01

It has been demonstrated that the pellet feed technique can achieve leveling of chromium concentration in Czochralski growth of Cr, Nd:GGG crystals, but there are serious problems. The most serious one is the presence of iridium inclusions from using the leveling technique. It would be best to attack the problem by preheating the feed material. Observed local variations in refractive index are attributed to variation in chromium concentration. Stress birefringence has varied somewhat in degree and distribution from run to run, but has generally been rather strong in spite of the use of extended necking before starting the cone, efforts to achieve smooth control, etc. DOE

ION BEAM CHANNELING IN SUPERLATTICES
W. K. Chu, W. R. Allen, S. T. Picraux, and J. A. Ellison 1986 5 p Presented at the Materials Research Society Spring Meeting, Palo Alto, Calif., 15 Apr. 1986 Prepared in cooperation with Sandia National Labs., Albuquerque, N. Mex. and New Mexico Univ., Albuquerque
(Contract DE-AC04-76DP-00789)
(DE86-010094; SAND-85-2388C; CONF-860445-9) Avail: NTIS HC A02/MF A01

Ion beam channeling analysis has recently been applied to lattice strain measurements on strained-layer superlattices (SLS). In this review talk, we outline three different methods of strain measurement: axial dechanneling, angular scans, and planar resonance. We describe the principles and illustrate them with examples; we also give a detailed theoretical treatment of the planar resonance effect in SLS's. DOE

DEPOSITION OF CRYSTALLINE SEMICONDUCTOR LAYERS ON AMORPHOUS SUBSTRATES (GRAPHOEPITAXY) Final Report, Jun. 1984
Armin Raeuber and Helmut Hirth Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 66 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-160; ISSN-0340-7608; ESA-86-97441) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14

Oriented monocrystalline GaAs layers were prepared on insulating substrates. Oxidized silicon wafers served as substrates because of their excellent surface quality and the possibility of developing Si/SiO2/GaAs sandwich structures. The GaAs was deposited by chemical vapor deposition techniques. Nucleation and overgrowth experiments were performed using etched or deposited structures with dimensions of a few microns as nucleation activators. The selectivity of nucleation is very high, surfaces without activation staying completely free of deposition. Nucleated crystals are in many cases uniform in orientation but not in diameter. Overgrowth experiments were successful when growth was started on a GaAs substrate but were difficult with nucleated crystals. ESA

DEVELOPMENT OF MODELS FOR THE SIMULATION OF THE TEMPERATURE BEHAVIOR OF MOSFETS IN ANALOG AND DIGITAL CIRCUITS IN THE TEMPERATURE RANGE BETWEEN MINUS 55 DEG C TO PLUS 150 DEG C Final Report, Jul. 1984
Juergen Koettnitz, Wolfgang Krautschneider, and Hans-Guenther Wagemann Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 101 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-167; ISSN-0340-7608; ESA-86-97445) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 21.50

The semiconductor fundamentals responsible for the temperature behavior of MOS transistors (intrinsic density, carrier mobility, interface state charge, oxide charge, difference of work functions)

were investigated and used for the development of simulation models. Methods to extract model parameters from measured characteristics (e.g., threshold voltage, inversion layer mobility, mobility reduction factor, parasitic series resistance, electrical length of the channel) are presented. Parameters obtained with a physical approach supply indications for further improvement of the models and provide a quality control for the semiconductor technology. ESA

DEVELOPMENT OF HUMIDITY SENSORS IN TANTALUM THIN FILM TECHNOLOGY Final Report, Dec. 1983
Christian Borgwardt, Traugott Kallfass, and Ernest Lueder Bonn Bundesministerium fuer Forschung und Technologie Dec. 1985 129 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-85-175; ISSN-0340-7608; ESA-86-97447) Avail: NTIS HC A07/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 27

Dielectric humidity sensors using tantalum thin film technology were manufactured. Tantalum oxide, formed by anodization of sputtered, M-doped, low density tantalum, was used as a porous dielectric layer sensitive to humidity. Among different structures investigated for the electrodes, the best performance was achieved by comb-like, selfaligned electrodes. Capacitance of the dry sensor is between 700 and 1000 pF, tangent of the loss angle at 1 kHz between 10% and 30%; sensitivity 0.5% to 1.5% per % relative humidity (RH) at 50 c and 1kHz; temperature coefficient 5%o/K (temperature between 10 and 50 C, RH 50%, 1 kHz); time characteristics for a change in humidity from 5% to 90% at 20 C are time constant i.e., less than 10 sec, rise time 90% about 45 sec. Simple measuring circuits were developed for the evaluation of the sensor signals. The comb-like sensor was integrated in a thin film hybrid circuit. ESA

THE BEHAVIOR OF NONROTATIONAL STRIATIONS IN SILICON Final Report, Dec. 1981
Helmut Koehler Bonn, West Germany BMFT Dec. 1985 44 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-W-85-014; ISSN-0170-1339; ESA-86-97458) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 9.50

Striations in silicon were studied to determine the effects of gravity and the gradients of surface strain (Marangoni effect). Crystallization of silicon melts in quartz and borum nitride containers of Si melting drops with free surface were studied under gravity and weightlessness. Under destabilizing temperature gradients, nonrotational striations are observed and can be correlated to cellular convection theory. The transition from striated to homogeneous material is described by the critical Rayleigh number. Silicon melts with free surface (molten tip of Si rod) show extended striations due to time-dependent surface driven flow (Marangoni effect). In a Spacelab experiment a molten silicon drop with a free surface slowly crystallized under zero gravity confirms the existence of the Marangoni effect under weightlessness. ESA

MAGNETIC PROPERTIES IN THE PARAMAGNETIC AREA OF TWO FERROMAGNETIC SUPERCONDUCTORS Ph.D. Thesis [MAGNETISCHE EIGENSCHAPPEN, IN HET PARAMAGNETISCHE GEBIED, VAN TWEE FERROMAGNETISCHE SUPERGELEIDERS]
Armand Pruijmboom May 1984 77 p In DUTCH
(ESA-86-97377) Avail: NTIS HC A05/MF A01

Susceptibility measurements in the temperature range 1.5 to 4.2 K were carried out on an Ho1,2Mo6S8 preparation and ErRh1,1Sn3,6 monocrystals using a SQUID and a 10T (i.e., a 0 to 10 Telsa magnetic field variability) susceptometer. A reliable value for the Curie-constant was found while calibrating the 10T disposition. Measurements at H=0 field strength yield an effective ground state moment of 10.16 muB/atom and a 0.11 K paramagnetic Weiss temperature dependance of the Curie-constant which corresponds to the existence of a still lower situated doublet with smaller effective moment is found. A model for the exchange of energy between the spin system, and the conduction electron system and the grid system (in which the conduction electrons exchange energy with the liquid He via the grid) was developed to explain the behavior of the relaxation time above lambda temperature. ESA

INVESTIGATION OF THREE FERROMAGNETIC SUPERCONDUCTORS IN THE MILLI-KELVIN AREA Ph.D. Thesis [ONDERZOEK AAN DRIE FERROMAGNETISCHE SUPERGELEIDERS IN HET MILLIKELVINGEBIED]
Eric Gerritsen May 1984 98 p In DUTCH
(ESA-86-97380) Avail: NTIS HC A05/MF A01

The ternary bonds Ho12Mo6S8 (1), ErRh4Sn3,6 (2), and ErRh4B4 (3), were prepared and investigated, using a 3He-4He mix-cooling machine to create a 100 mK temperature area in which superconductivity and ferromagnetic order can coexist. Direct Current Magnetization (DCMM's) and Resistance Measurements (RM's), were carried out using a SQUID. Crystals of (2) were prepared from Er:Rh melt ratios of 1:1 (a), and 1:2 (b). The DCMM's show ferromagnetic order at temperatures Tc2 of 0,75 K, and 0.52 K. The RM's show superconductivity for only a small part of the (a)-crystals at a temperature Tc1=0.5 K, but a complete superconductivity for the (b)-crystals at Tc1=1.07 K. Temperatures for which the crystals become normal again are 0.66 K (a), and 0.38 K (RM) and 0.52 K (DCMM) for (b). A method to reduce magnetization changes to absolute values for susceptibility was determined. For preparation (3) a Tc1=8.7 K is found. ESA

DYNAMIC SUSCEPTIBILITY ON TWO FIRST-ORDER PHASE TRANSFORMATIONS Ph.D. Thesis [DE DYNAMISCHE SUSCEPTIBILITEIT OP TWEE EERSTE ORDE FASE OVERGANGEN]
J. L. Top May 1984 100 p In DUTCH
(ESA-86-97381) Avail: NTIS HC A05/MF A01

The differential susceptibility of monocrystals in liquid He was measured at 1.64 to 4.2 K with varying magnetic background, magnetic frequency, and the angle in one crystal plane. Anisotropy and critical field strength of the spinflop system CsMnBr3.2H2O were determined as a function of temperature. Assuming a dependence of the activating energy upon the strong coupling in the chains, the relaxation time of the phase transformation was measured (which confirmed the nucleation theory). The axis of preferance in the ac-plane of the metamagnet RbCoCl3.2H2O was unequivocally determined. The angle dependent susceptibility in the phase transformation was explained by the strong anisotropy of the system. The demagnetization factor of an almost ideal spherule was obtained by grinding a crystal. The domain wall relaxation in the phase transformation as a function of the field was investigated. The relaxation time appears minimal in the middle of the transformation and increases when one phase prevails. ESA

SOME FEATURES OF SUSY BREAKING IN N=2 SUPERGRAVITY
S. Cecotti, L. Giradello, and M. Porrati Aug. 1984 11 p
(DE85-703198; IC-84/115) Avail: NTIS (US Sales Only)
HC A02/MF A01

We discuss some features of SUSY breaking in N=2 supergravity. Firstly, we show that in a general N=2 Sugra model (constructed according to the tensor calculus) all stationary points of the potential, at (LAMBDA)=0, are fully supersymmetric if the compensating multiplet is not gauged. Thus a viable super-Higgs effect in N=2 supergravity can occur only in the presence of a Fayet-Iliopoulos term. Then we present an explicit model with two scales of breaking in anti-de Sitter space. Moreover, the ratio of the two gravitino masses is sliding i.e., not determined by the classical potential. In the extreme situation one of the gravitino mass equals (RADICAL)-(LAMBDA)/3, and thus we have partial super-Higgs (in AdS space). The cosmological constant may be arranged to an arbitrary small value while keeping the mass of the heavy gravitino constant. DOE

METHODOLOGY FOR GENERATING EFFICIENCY AND EFFECTIVENESS MEASURES (MGEEM): A GUIDE FOR COMMANDERS, MANAGERS AND SUPERVISORS Final Report, 1 Jul. 1984 - 31 Jan. 1986
Thomas C. Tuttle and Charles N. Weaver May 1986 28 p
(Contract F33615-83-C-0030)
(AD-A167503; AFHRL-TP-86-26) Avail: NTIS HC A03/MF A01
CSCL 05/1

MGEEM is a multi-step procedure which permits the creation in any organization of a complete productivity measurement system. It provides an overview of the MGEEM process and identifies anticipated benefits, costs, and risks for the Air Force commander, manager, or supervisor contemplating its use. The companion TP, Implementing MGEEM: A Manual for Air Force Measurement Facilitators, provides sufficient technical detail to guide a measurement facilitator through the operational use of the procedure. In a target organization, the MGEEM process begins when a measurement facilitator uses a structured group technique to bring about consensus among the commander (manager or supervisor) and his/her immediate subordinates concerning the organization's principal intended accomplishments, called Key Result Areas (KRAs). In the second step, the facilitator again uses a structured group technique to bring about consensus among another group, the commander's immediate subordinates and selected members of their immediate subordinates, on the question of what the commander needs to know how well the organization is doing on each KRA. AN ANALYSIS OF THE DEFENSE SPACECRAFT MARKET M.S. Thesis
Brad S. Bigelow Dec. 1985 174 p
(AD-A167602; AFIT/GSO/ENS/85D-2) Avail: NTIS
HC A08/MF A01 CSCL 05/3

This study examines the defense spacecraft market in the context of the classical industrial organization paradigm. It takes as the basis for its evaluation of the market the concept of effective competition, using the criteria proposed by Stephen Sosnick in his article, Toward a Concrete Concept of Effective Competition. The thesis begins by briefly describing the origin and evolution of the military space program. It then addresses the structure of the market, outlining the composition and concentration of the industry, the nature of the product, the extent of demand, and the conditions of supply. It discusses the particular structural features of the Department of Defense market. It shows how the conduct of the

market is predominantly influenced by the DOD acquisition process for space systems. The examination of market performance focuses on internal and allocative efficiency, revealing a dramatic decline in productivity since the mid-1960s, due in large part to the increase in the unit cost of materials. It concludes by highlighting the links between the structure, conduct, and performance and shows how deviations for effective competition in the market result from these interactions. GRA

PRODUCTION AND INVENTORY CONTROL WITH THE BASE STOCK SYSTEM
J. P. J. Timmer, W. Monhemius, and J. W. M. Bertrand May 1984 39 p
(EUT/BDK/12; ISBN-90-6757-012-5; ESA-86-97686) Avail: NTIS HC A03/MF A01

Base stock control (BSC), of safety stocks in a multiproduct multiphase production system is compared with techniques such as master product scheduling. It is shown that BSC results in good control with a low level of safety stocks and reduced control effort. ESA

N86-32329# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
BALANCING PRODUCTION LEVEL VARIATIONS AND INVENTORY VARIATIONS IN COMPLEX PRODUCTION SYSTEMS
J. W. M. Bertrand Apr. 1984 18 p
(THE/BDK/84; ESA-86-97688) Avail: NTIS HC A02/MF A01

The behavior of production levels and stocks in an integrally controlled multiproduct multiphase production system is analyzed. It is shown that certain types of variations in the master production schedule (MPS) may lead to large short term variations in production. To reduce the costs of these variations production smoothing is introduced; a modification of well-known integral production decision rules is derived to realize smoothed production behavior. The quantitative effects of the production smoothing rule on the variations in stocks and production levels are demonstrated. A cost model to determine appropriate values for the smoothing parameters, given a specific production structure, a given capacity structure, and a given variability of the MPS is outlined. ESA

CALCULATING WORKLOAD NORMS FOR JOB SHOPS
J. W. M. Bertrand Apr. 1984 5 p
(BDK/KBS/84-04; ESA-86-97689) Avail: NTIS HC A02/MF A01

A job scheduling and due date assignment rule that adapts the flow time allowance per operation to the time-aggregated remaining workload per work center is described. The method is valid for jobs requiring a linear sequence of operations as well as for single and multilevel assembly types of jobs. Flow time allowances are based on the remaining workload for the work center where the operation is to be performed. To determine an initial schedule, each operation of a job is given an operation due date, which is equal to the maximum operation due date of the previous operation(s), plus the flow time allowance. ESA

N86-32331# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
THE TRADE-OFF MODULE: AN AID TO BALANCE LOGISTICALLY RELATED COSTS [DE TRADE - OFF - MODULE: EEN HULPMIDDEL BIJ HET BALANCEREN VAN LOGISTIEK GERELATEERDE KOSTEN]
P. Durlinger Dec. 1984 20 p In DUTCH
(BDK/KBS/84-06; ESA-86-97690) Avail: NTIS HC A02/MF A01

A model, called the Trade-off Module (TOM), was developed in order to assist in the balancing of the costs between the different divisions in an industry. The model calculates the logistic and economic consequences of decisions concerning delivery times, delivery reliability, size of production series, and production packages. The TOM can be applied on assembly line level. A production unit model, simplified to such an extent that big mistakes on a lower level are excluded, is described. The position of the TOM within the decision hierarchy is outlined. The gray box method used for the application of the TOM in practice is explained. The passage time in a production unit was calculated. The dual constraint (man and machine) problem is explained. ESA

N86-32332# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
THE STRUCTURING OF PRODUCTION CONTROL SYSTEMS
J. W. M. Bertrand and J. Wijngaard May 1984 46 p
(THE/BDK/ORS/84/10; ESA-86-97691) Avail: NTIS HC A03/MF A01

A qualitative methodology for designing hierarchically structured production control systems for complex production situations is presented. The methodology is based on the assumption that complexity should be reduced by defining self-contained subsystems with clear and well-defined operational characteristics. Interactions between the subsystems should be simple and restricted. The production unit (PU) is introduced as a basic control entity. From the perspective of goods flow control the PU's are black boxes having certain operational characteristics. The objective of goods flow control is to realize a delivery performance, taking into account the PU-operational constraints. The main elements in the goods flow control structure developed are master planning, material coordination, workload control and work order release. ESA

N86-32333# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
DUE-DATE RELIABILITY IN A REPAIR SHOP: IMPLICATIONS FOR ORGANIZATIONAL AND WORK DESIGN
H. Kuipers, P. Reinking, and J. C. Wortmann Jul. 1984 29 p
(THE/BDK/KBS/84-14; ESA-86-97692) Avail: NTIS HC A03/MF A01

The design and introduction of a work-order control system in a repair shop to increase the shop's due-date reliability under conditions of uncertainty are discussed. The consequences of the control system for organizational structure and work design are illustrated. The system has far reaching implications for the responsibilities and tasks of employees at each level. Organizational changes, based on notions of the contingency approach are described. Task-design and group-design theory is used to analyze the task-content implications. ESA

N86-32334# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
STRUCTURING THE PRODUCTION CONTROL PROBLEM IN A REPAIR SHOP
J. C. Wortmann and K. Tol Aug. 1984 9 p
(THE/BDK/KBS/84-16; ESA-86-97693) Avail: NTIS HC A02/MF A01

The production control system in a repair shop was improved by structuring the control problem, i.e., decomposing the problem into a number of weakly interdependent subproblems. The proposed control structure distinguishes a master planning level, that sets due-dates for major phases of a repair order; a materials coordination level, that coordinates suborders; and a departmental control level to deal with suborders. A decomposition of the information system into a master planning system and a detailed planning system follow from the control structure. ESA

N86-32335# Technische Hogeschool, Eindhoven (Netherlands). Dept. of Industrial Engineering and Management Science.
A COMPARISON OF CAPACITY ORIENTED AND PRODUCT ORIENTED APPROACHES TO GOODS FLOW CONTROL
Roland Bemelmans and Jacob Wijngaard Apr. 1984 20 p
(ARW-03-THE-BDK/ORS/84/11; ESA-86-97700) Avail: NTIS HC A02/MF A01

The product oriented and the capacity oriented approaches to goods flow control in a multiproduct multistage make-to-stock situation are compared. No clear superiority of either approach is revealed, but the capacity oriented approach makes the relationship to higher levels of control easier. It is possible to combine capacity adjustment decisions with capacity usage decisions. The product oriented approach needs a separate (aggregate) model to make the capacity adjustment decision and it is not always easy to couple this level of decision making properly to the (detailed) product oriented approach of the goods flow control level. ESA

DATABASE CAPACITY PLANNING AND MANAGEMENT
K. Linsenmann 1986 24 p Presented at the 15th International Software AG Users Conference, San Diego, Calif., 11 May 1986
(Contract DE-AC07-76ID-01570)
(DE86-009076; EGG-M-03286; CONF-860593-1) Avail: NTIS HC A02/MF A01

The DATABASE ADMINISTRATION (DBA) has developed a utility process that performs three functions utilizing the ADABAS general control block (GCB) and the ADABAS file control block (FCB). The three functions are file space management, automated file unload/load and physical file placement and management. ADABAS cost per command, ADABAS command durations and labor cost have been examined. DOE

CARBON DIOXIDE INFORMATION CENTER THESAURUS
R. E. Millemann and R. M. Cushman Apr. 1986 62 p
(Contract DE-AC05-84OR-21400)
(DE86-009013; ORNL/CDIC-5) Avail: NTIS HC A04/MF A01

This thesaurus lists the keywords (including narrower, broader, and related terms, as well as forbidden terms) used by the Carbon Dioxide Information Center for the input and retrieval of records for its Bibliographic Information System (BIS). BIS is a specialized bibliographic data base on carbon dioxide and climate. It is being merged into the Department of Energy's Energy Data Base (EDB). The keywords used in the BIS Thesaurus are also used in the much larger EDB thesaurus so EDB may be searched for CO_2 records. DOE

COMPUTING SERVICES SOFTWARE LIBRARY
L. M. Clark and W. H. Jones Mar. 1986 52 p
(Contract W-31-109-eng-38)
(DE86-009491; ANL/TM-436) Avail: NTIS HC A04/MF A01

This technical memorandum serves as a practical guide for managers, supervisors, programmers, analysts, and other data processing personnel who need to consult the documentation or use the software available in the Software Library. Policies and procedures necessary to preserve the software documentation and protect the Laboratory's investment in software are presented. Included are sections on responsibilities of the Software Librarian and Software Coordinators, software change control policy, systems programming section software maintenance tools, information systems section software maintenance tools and use of the LIBRARY exec. The LIBRARY exec, which serves as the Master Index, provides on-line information about documents. DOE

COHERENCE MAINTENANCE IN DISTRIBUTED DATABASE SYSTEMS Ph.D. Thesis [MAINTIEN DE LA COHERENCE DANS LES SYSTEMES D'INFORMATION REPARTIS]
Roland Balter 1985 186 p In FRENCH
(ESA-86-97292) Avail: NTIS HC A09/MF A01

Coherence control in distributed systems is studied. The coherence, transaction and atomization concepts are discussed. The properties of coherence control mechanisms are analyzed. The solutions found in the development of the SCOT project are recalled. The definition of a transactional base adapted to the SCOT functional requirements is presented. Errors and faults management is discussed. A comparative analysis of lock-out mechanisms allows the identification of access synchronization techniques. The results are used in distributed database systems design. ESA

BRIEF REPORT ON DESIGN AND IMPLEMENTATION OF A DATA BANK CORE SYSTEM [KURZBERICH UEBER ENTWURF UND IMPLEMENTIERUNG EINES DATENBANKKERN-SYSTEMS]
Hans-Joerg Schek *In its* Reports on Cartography and Geodesy. Series 1: Original reports, No. 95 1985 p 135-141 In GERMAN; ENGLISH summary (For primary document see N86-31946 23-43)
Avail: NTIS HC A09/MF A01

83 ECONOMICS AND COST ANALYSIS

Includes cost effectiveness studies.

No abstracts in this category.

84 LAW AND POLITICAL SCIENCE

Includes space law; international law; international cooperation; and patent policy.
